

Exercises 2

1. Diagram algebras and H -reduction

Recall the arguably most important diagram monoids:

Symbol	Diagrams	Symbol	Diagrams
pPa_n		Pa_n	
Mo_n		$RoBr_n$	
TL_n		Br_n	
pRo_n		Ro_n	
pS_n		S_n	

Fix some field \mathbb{K} . In all cases, the respective algebras are obtained by evaluating floating components to a fixed $\delta \in \mathbb{K}$. (If that doesn't make sense to you, then I have messed up: my bad...)

- Classify the simple modules for your favorite(s) of these diagram algebras.
- (*) If you know the quantum versions of these algebras, such as the BMW algebra, then try those as well.

2. Finite fun with dihedral groups – classical

Let \emptyset denote the unit and let $D_n = \langle 1, 2 | 1^2 = 2^2 = (12)^n = \emptyset \rangle$ be the dihedral group of the n gon.

- Use *e.g.* the Magma online calculator (see below) to guess the classification of simple D_n -modules over \mathbb{C} . You can use the code

```
n:=5;
CharacterTable(DihedralGroup(n))
```

$n = 4 :$	<table border="1"> <thead> <tr><th>Class</th><th>1</th><th>2</th><th>3</th><th>4</th><th>5</th></tr> </thead> <tbody> <tr><td>Size</td><td>1</td><td>1</td><td>2</td><td>2</td><td>2</td></tr> <tr><td>Order</td><td>1</td><td>2</td><td>2</td><td>2</td><td>4</td></tr> </tbody> </table>	Class	1	2	3	4	5	Size	1	1	2	2	2	Order	1	2	2	2	4	,	$n = 5 :$	<table border="1"> <thead> <tr><th>Class</th><th>1</th><th>2</th><th>3</th><th>4</th></tr> </thead> <tbody> <tr><td>Size</td><td>1</td><td>5</td><td>2</td><td>2</td></tr> <tr><td>Order</td><td>1</td><td>2</td><td>5</td><td>5</td></tr> </tbody> </table>	Class	1	2	3	4	Size	1	5	2	2	Order	1	2	5	5																																													
Class	1	2	3	4	5																																																																													
Size	1	1	2	2	2																																																																													
Order	1	2	2	2	4																																																																													
Class	1	2	3	4																																																																														
Size	1	5	2	2																																																																														
Order	1	2	5	5																																																																														
	<table border="1"> <thead> <tr><th>p</th><th>2</th><th>1</th><th>1</th><th>1</th><th>1</th><th>2</th></tr> </thead> <tbody> <tr><td>X.1</td><td>+</td><td>1</td><td>1</td><td>1</td><td>1</td><td>1</td></tr> <tr><td>X.2</td><td>+</td><td>1</td><td>1</td><td>-1</td><td>1</td><td>-1</td></tr> <tr><td>X.3</td><td>+</td><td>1</td><td>1</td><td>1</td><td>-1</td><td>-1</td></tr> <tr><td>X.4</td><td>+</td><td>1</td><td>1</td><td>-1</td><td>-1</td><td>1</td></tr> <tr><td>X.5</td><td>+</td><td>2</td><td>-2</td><td>0</td><td>0</td><td>0</td></tr> </tbody> </table>	p	2	1	1	1	1	2	X.1	+	1	1	1	1	1	X.2	+	1	1	-1	1	-1	X.3	+	1	1	1	-1	-1	X.4	+	1	1	-1	-1	1	X.5	+	2	-2	0	0	0			<table border="1"> <thead> <tr><th>p</th><th>2</th><th>1</th><th>1</th><th>4</th><th>3</th></tr> </thead> <tbody> <tr><td>p</td><td>5</td><td>1</td><td>2</td><td>1</td><td>1</td></tr> <tr><td>X.1</td><td>+</td><td>1</td><td>1</td><td>1</td><td>1</td></tr> <tr><td>X.2</td><td>+</td><td>1</td><td>-1</td><td>1</td><td>1</td></tr> <tr><td>X.3</td><td>+</td><td>2</td><td>0</td><td>Z1</td><td>Z1#2</td></tr> <tr><td>X.4</td><td>+</td><td>2</td><td>0</td><td>Z1#2</td><td>Z1</td></tr> </tbody> </table>	p	2	1	1	4	3	p	5	1	2	1	1	X.1	+	1	1	1	1	X.2	+	1	-1	1	1	X.3	+	2	0	Z1	Z1#2	X.4	+	2	0	Z1#2	Z1
p	2	1	1	1	1	2																																																																												
X.1	+	1	1	1	1	1																																																																												
X.2	+	1	1	-1	1	-1																																																																												
X.3	+	1	1	1	-1	-1																																																																												
X.4	+	1	1	-1	-1	1																																																																												
X.5	+	2	-2	0	0	0																																																																												
p	2	1	1	4	3																																																																													
p	5	1	2	1	1																																																																													
X.1	+	1	1	1	1																																																																													
X.2	+	1	-1	1	1																																																																													
X.3	+	2	0	Z1	Z1#2																																																																													
X.4	+	2	0	Z1#2	Z1																																																																													

and vary n .

- Show that your guessed classification is true.

c) (*) What happens for general fields?

3. Infinite fun with dihedral groups – à la KL

Retain the notation from Exercise 2. For a field \mathbb{K} consider the group algebra $S = \mathbb{K}[D_\infty]$ of the infinite dihedral group $D_\infty = \langle 1, 2 \mid 1^2 = 2^2 = \emptyset \rangle$. Every element of D_∞ has a unique reduced expression. We write $k, 1, 2$ and $k, 2, 1$ for the reduced expressions $\dots 12$ and $\dots 21$ in k symbols.

The algebra S has a KL basis $\{b_w \mid w \in D_\infty\}$ (whose precise definition does not matter) with identity b_\emptyset . Set $b_{0,a,b} = 0$. The nonidentity multiplication rules are given by the Clebsch–Gordan formula:

$$b_{k,1,2}b_{j,1,2} = \begin{cases} 2b_{|k-j|+1,1,2} + \dots + 2b_{|k+j|-1,1,2} & j,1,2=2\dots 12, \\ b_{|k-j|,1,2} + 2b_{|k-j|+2,1,2} + \dots + 2b_{|k+j|-2,1,2} + b_{|k+j|,1,2} & j,1,2=1\dots 12. \end{cases}$$

There are also similar formulas with $b_{j,2,1}$ on the right or $b_{k,1,2}$ on the left.

For example:

$$\begin{aligned} b_{1212}b_{21212} &= 2b_{12} + 2b_{1212} + 2b_{121212} + 2b_{12121212}, \\ b_{1212}b_{121212} &= b_{12} + 2b_{1212} + 2b_{121212} + 2b_{12121212} + b_{1212121212}. \end{aligned}$$

- a) Compute the cell structure of S with respect to the KL basis $\{b_w \mid w \in D_\infty\}$ for $\text{char}(\mathbb{K}) \neq 2$. Skip the identification of the nontrivial $S_{\mathcal{H}}$ for now.
- b) (') Compare the nontrivial $S_{\mathcal{H}}$ of S to the Grothendieck algebra of complex finite dimensional $\text{SO}_3(\mathbb{C})$ -representations.
- c) What happens in characteristic two?

4. Finite fun with dihedral groups – à la KL

Retain the notation from Exercise 3. Let $S = D_n = \langle 1, 2 \mid 1^2 = 2^2 = (12)^n = \emptyset \rangle$ be the dihedral group of the n gon. The longest element is $w_0 = n, 1, 2 = n, 2, 1$.

With respect to the KL basis and its multiplication rules, the only change compare to D_∞ is that expressions of the form (here $d > 0$)

$$b_{n-d,1,2} + b_{n+d,1,2} \mapsto 2b_{w_0}, \quad b_{n-d,2,1} + b_{n+d,2,1} \mapsto 2b_{w_0}.$$

are replaced as indicated. This is the truncated Clebsch–Gordan formula.

For example, for $n = 6$ one gets:

$$\begin{aligned} b_{1212}b_{21212} &= 2b_{12} + 2b_{1212} + 2b_{121212} + 2b_{12121212} = 2b_{12} + 6b_{121212}, \\ b_{1212}b_{121212} &= b_{12} + 2b_{1212} + 2b_{121212} + 2b_{12121212} + b_{1212121212} = 8b_{121212}. \end{aligned}$$

- a) Compute the cell structure of S with respect to the KL basis $\{b_w \mid w \in D_n\}$ for $\mathbb{K} = \mathbb{C}$ and odd n . Skip the identification of the nontrivial $S_{\mathcal{H}}$ for now.
- b) (') In Exercise 3 we have seen that the representation theory of the infinite dihedral group for the middle cell is controlled by $\text{SO}_3(\mathbb{C})$. Show that the same is true in finite type when working with an appropriate semisimplification of $\text{SO}_3(\mathbb{C})$ -representations.
- c) (*) What are the nontrivial $S_{\mathcal{H}}$ explicitly?
- d) What is the difference between odd and even n ?
- e) (*) What happens over general fields?

- There might be typos on the exercise sheets, my bad. Be prepared.
- Star exercises are a bit trickier; prime exercises use notions I haven't explained.
