A term is an object so far as that object is undergoing shaping in a directed act of inquiry.

John Dewey

In The Order of Things, Michel Foucault identified three arenas of discourse that in their (unstable and incomplete) coalescence at the end of the Classical Age constituted the object called "Man"—"l'homme." This figure emerges at the intersection of three domains—Life, Labor and Language—unstably unified around (and constituting) a would-be sovereign subject. The doubling of a transcendental subject and an empirical object and their dynamic and unstable relations defined the form of this being. In 1966, Foucault held an epochal view of Man and of Modernity. In his conclusion, Foucault intimated the imminent coming of a new configuration of language about to sweep the figure of Man away like "a face drawn in the sand at the edge of the sea." It now appears this presage was miscast: in the ensuing decades language (in its modality as poetics) has not turned out to be the site of radical formal transformations through which this being, Man, would either disappear entirely (as Foucault intimated) or would transmute into a new type of being as predicted by Gilles Deleuze.

Although Foucault did not directly return to his diagnosis of the "end of Man," he did modify his understanding of modernity as an epoch. In his essay "What is Enlightenment?" Foucault posed the challenge of inventing a new philosophic relationship to the present; one in which modernity was taken up not through the analytic frame of the epoch but instead through a practice of inquiry grounded in an ethos of present-orientation, of contingency, of form-giving. Perhaps today one

(but only one) significant challenge of forging a modern ethos lies in thinking about how to relate to the issue of anthropos. Such a task presents different types of challenges to philosophical thinkers such as Foucault than to the anthropologist. Regardless of how one approaches those questions (an issue to which we return in the conclusion), what if we took up recent changes in the logos of life, labor, and language not as indicating an epochal shift with a totalizing coherence (sovereignty, Man) but, rather, as fragmented and sectorial changes that pose problems, both in-and-of-themselves as well as for attempts to make sense of what form(s) anthropos is currently being given.

Labor, Life, Language

In 1966, capitalism was strong in its enclaves but not completely unchallenged: it had yet to face what now appears to have been a hopeless socialism and failed schemes of Third World development of whatever political and economic form. In 2001, no one can doubt that capitalism is more expansive, destructive, and productive than ever before. No one can doubt the growing scope and scale of market relations and the concomitant commodification of an ever-greater range of things previously held to be external to the realm of monetary value. However, today there exists neither a logos adequate to understanding this globalizing eikastos nor a means of regulating its volatility. In 1966, the mechanics of the genetic code and its extraordinary universality was just being discovered. The ensuing decades have seen the most dramatic and significant changes in the life sciences since Darwin. Yet no molecular Darwin has yet appeared to provide a unifying logos. Where and when and whether the technology-driven advances of genomics and biotechnology will transform into an understanding of living beings that is more adequate to their evident complexity remains to be seen. Although in 1966 semiotics, and/or cybernetics, and/or cognitive science, competed to unify all language, today—even though we are in the midst of a revolution in the invention and spread of technologies of communication and information—there exists no unifying logos of discourse.

At the very least, then, we can say that we are currently undergoing and participating in a distinctive set of reflections of labor, life, and language. Perhaps, after all, the project of seeking Man—life, labor, language as the logos of modernity—has been dissolved. Or it may be that seeking such a logos actually was the wrong approach. Perhaps the multiplication and heterogeneity of recent logos has put anthropos once again into question. We can see more clearly today that Foucault's Man was only one instantiation of the figure of anthropos. However, the one thing we should not be doing is attempting to find a new, hidden, deeper, unifying rationality or ontology. The alternative is not chaos. Rather, using the concept of problematization, and the topic of anthropos, we can direct our efforts toward inventing means of observing and analyzing how various logos are currently being assembled into contingent forms.
Inquiry: From Reconstruction to Problematization

This surfest of forms of knowledge is problematic. It is challenging to find ways to deal with such a situation. To do so, we pursue our convocation of Dewey and Foucault, two thinkers who made the issues of encumbrances, discords, and problems into topics of inquiry.

In 1916, John Dewey re-published a group of his essays (originally published in 1903) under the title Essays in Experimental Logic. He opened his long "Introduction" by advising his readers that "the key" to his essays was to be found in his emphasis on "the temporal development of experience." Thinking was itself a temporal experience, or, to be more precise, thinking was a temporal experiment. Terms such as "thinking," "reflection," "judgment," Dewey asserted, are not faculties but, rather, denote inquiries or the results of inquiries, and that inquiry occupies an intermediate and mediating place in the development of an experience." Dewey's summation of the logic of experiment and experience places reason squarely in an intermediate position and assigns it a mediating function. Thinking takes place in a milieu; playing on the original sense of the term "mi-lieu" - between places - one can say that thinking takes place between places but not just anywhere, or anytime. Dewey explains: "From the standpoint of temporal order, we find reflection, or thought, occupying an intermediate and reconstructive position. It comes between a temporally prior situation (an organized interaction of factors) of active and appreciative experience, wherein some of the factors have become discordant and incompatible, and a later situation, which has been constituted out of the first situation by means of acting on the findings of reflective inquiry. The final solution thus has a richness of meaning, as well as a controlled character lacking in the original." Dewey's claims are both persuasive and contestable.

For Dewey, then, thinking is not only a practice set in a dynamic milieu; it is an action called forth and set into motion by a discordancy. The function of thinking is to rectify - in the sense of "realign" - the factors that have produced, and/or have been altered by, a disruption. In order to fulfill its function, thinking (and hence, presumably the thinker) must take up an active relationship to the milieu in which she finds herself. Further, Dewey assigns thinking the task of providing a reconstructive "richness of meaning," although exactly what he means by "richness" remains vague. Thinking, then, is a situated practice of active inquiry whose role and goal is to initiate a motion that results in a movement from a discordant situation to a less discordant situation. Thinking is neither more nor less than this practice.

The value terms by which the norms of that motion (and the practice) are guided and judged are control and meaning. Control and meaning are not subjective terms. Neither the primary locus nor the yardstick of this practice is to be found in the subject. Dewey makes this point through a striking, if ambiguous, formulation: "it is the needs of a situation which is determinative." We can gloss his claim by saying that thinking is a temporally unfolding, situated practice, the function of which is to clarify and to realign a problematic situation. The site of the trouble and the resolution is the problematic situation. Intervention is judged successful when it yields a reconstructive change through meeting the needs of a situation. Intervention and inquiry are essentially practical. Dewey, after all, was a pragmatist, an optimist, and an American. Thinking operated with no fixed universal principles, no pre-given and unalterable faculties. Whether there are situations that cannot be repaired is not a question that can be answered in the abstract. Nonetheless, one can raise the issue of whether Dewey allows sufficient space either for critical limits or a sense of pathos or tragedy, and if not, whether this lack is a major limitation of his work. The answer is complicated, as Dewey was made aware of these issues through repeated attacks by the Left and Right (theological and secular) in America over more than half a century.

A core ambiguity of Dewey's position can be located in his noteworthy metaphoric frame. For a metaphorical frame it is: How, we wonder, do situations have needs? Without entering into the vast literature of debate about functionalism, organismism, and anthropocentrism that characterized so much of 20th-century social thought, not to mention the equally vast scholarly production around metaphor to which the cultural sciences for the past half century have devoted so much effort, let us simply suggest, following Georges Canguilhem, that it is epistemologically and historically preferable to say that modern situations are normed. Or that, to be more precise, norms function actively so as to ceaselessly spread a grid of normativity into an expanding range of situations. Taken up from this angle, we can move from Dewey's approach to situations in general to a historically more specific subset of discordant dynamism.

Problematization

One can find a partial but pronounced resonance, a purely arbitrary one in terms of direct influence, in Michel Foucault's concept of "problematization." A "problematization," Foucault writes, "does not mean the representation of a pre-existent object nor the creation through discourse of an object that did not exist. It is the ensemble of discursive and non-discursive practices that make something enter into the play of true and false and constitute it as an object of thought (whether in the form of moral reflection, scientific knowledge, political analysis, etc.)." The reason why problematizations are problematic, not surprisingly, is that something prior "must have happened to introduce uncertainty, a loss of familiarity; that loss, that uncertainty is the result of difficulties in our previous way of understanding, acting, relating." Foucault, there are always several possible ways of responding to "the same ensemble of difficulties." Consequently, the primary task of the analyst is not to proceed directly toward intervention and repair of the situation's discordancy but, rather, to understand and to put forth a diagnosis of "what makes these responses simultaneously possible." In contrast to Dewey, Foucault stops short, in a rigorously self-limiting manner, of proposing means of rectification. The extent to which Foucault's practice could be assimilated to a reconstruction (in Dewey's sense) is
PAUL RABINOW

therefore complicated. He would seem to be constructing something like an ideal type, but since the sense of what Weber meant by ideal type has been massively misinterpreted, this comparison has limited utility.

For Foucault, the specific diacritic of thought is found not only in this act of diagnosis but additionally in the attempt to achieve a modal change from seeing a situation not only as "a given" but equally as "a question." Such a modal shift seeks to accomplish a number of things. First, it asserts that not only are there always multiple constraints at work in any historically troubled situation, but that multiple responses exist as well. Foucault underscores this condition of heterogeneous, if constrained, contingency - "this transformation of an ensemble of difficulties into problems to which diverse solutions are proposed" - in order to propose a particular style of inquiry. Foucault saw his calling as a contribution to the "freeing up" of possibilities. The act of thinking is an act of modal transformation from the contusive to the subjunctive. From the singular to the multiple, from the necessary to the contingent.

A problematization, then, is both a kind of general historical and social situation - saturated with power relations, as are all situations, and imbued with the relational "play of truth and false," a diacritic marking a subclass of situations - as well as a nexus of responses to that situation. Those diverse but not entirely disparate responses, it follows, themselves form part of the problematization as it develops or unfolds (although both words are too Hegelian) over time. What Foucault is attempting to conceptualize is a situation that is neither simply the product of a process of social and historical construction nor the target of a deconstruction. Rather, he is indicating a historical space of conditioned contingency that emerges in relation to (and then forms a feedback situation with) a more general situation, one that is real enough in standard terms, but is not fixed or static. Thus the domain of problematization is constituted by and through economic conditions, scientific knowledges, political actors, and other related vectors. What is distinctive is Foucault's identification of the problematic situation (the situation of the process of a specific type of problem-making), as simultaneously the object, the site, and ultimately the substance, of thinking.

It is important to notice that Foucault differs from Dewey on this point: Dewey identified discordant forces and a breakdown of meaning as the locus of experience and the target of action. From the very start of his methodological work, Foucault sought to bracket meaning as well as the standard form of truth claims. What was substituted, if that is not too mechanical a word, was a series of forms of nominalist seriousness, of which problematization was the last. Foucault's concept of problematization is broad but not unlimited in scope. It is surely not as general as Dewey's "discordance." Rather, Foucault requires that the situation in question contain institutionally legitimated claims to truth, or one or another type of sanctioned seriousness (Bert Dreyfus and I called them "serious speech acts"). Without the presence of serious speech act there is no problematization in the strict sense of the term (although obviously there could be problems).

In contrast to earlier positions that he held, Foucault's thinker is by definition, neither entirely outside of the situation in question nor entirely enmeshed within it without recourse or options. The defining trait of problematization does not turn on the couplings of opposites (outside or inside, free or constrained), but rather on the type of relationship forged between observer and problematized situation. The specificity of that relationship entails taking up the situation simultaneously as problematic and as something about which one is required to think.

The Market in Transnational Humanitarianism

The emergence of the complex of discourse, practices, and strategies lumped under the term "ethics," or "bioethics," or "medical ethics" indicates the presence of a problematized domain. One might well wonder: How did "ethical relations" become a zone of such charged importance? Upon reflection, however, we must pose some prior questions: When and under what circumstances did "ethical relations" become an object domain at all? How did they become a problem? And a solution? And thereby a new problem domain?

One can say that two of the most distinctive innovations of the 1990s infusion of anthropos were the visionary projects, technological developments, and institutional stabilizations of (1) genome mapping and (2) bioethics. Although biotechnics is perhaps a decade older than genome mapping, their trajectories have been in part entwined in recent years. Both genomic mapping and bioethics are increasingly transnational, although both were powerfully spearheaded in the United States. Laterally, European Commissions and numerous authorized spokespeople have elaborated and disseminated the associated doctrines and practices around the world. Thus, for example, following in the wake of the venture capitalists, biotech startups, and multinational pharmaceutical companies, more and more people around the world are growing accustomed to thinking about themselves (and their pets and plants and food) as having genomes. These genomes, it is believed, contain precious information that tells the truth about who they (and their pets and plants and food) really are, as well as providing clues to what their future holds. Influenced by the aforementioned purveyors of biopolitical futures, more and more people are also coming to believe that their genomes contain information that is rightfully their property. Not only is their individual and collective identity being violated, it is being pirated. Both multinationals and NGOs frequently work - however unequal they may be in their political struggles - to reinforce this view of the body and the self, ownership and truth. Power and resistance, it has been claimed, can act mutually, if unwittingly, so as to re-enforce a type of rationality and the forms that it takes.

Human Rights: Human Good?

Historian and journalist Michael Ignatieff makes a claim that is striking and, upon reflection, perplexing. The striking claim: "There has been a revolution in the moral imagination in the last fifty years, and its most distinctive feature is the emergence
and triumph of human rights discourse as the language of human good. The perplexity: is the claim true? A series of other perplexities spring to mind. What brought about this change? What was the dominant figure of moral imagination in Europe before World War II? Is there, in fact, a dominant figure of morality? Other related questions equally come to mind. For example: How does the human rights discourse relate to issues of health? How do both rights and health relate to biopolitics?

The contemporary self-evidence of the legitimacy of human rights discourse is even more striking when one realizes that before 1945 there existed no international legal framework for the protection of individual human rights. As Hannah Arendt made clear in her work on The Origins of Totalitarianism, those without passports ran the greatest risks, as only states (and their citizens) had rights. The fact of having been stripped of an official attachment to a nation left one in the most precarious and vulnerable state. This fact underscores the historical originality but also the rather curious condition instantiated by the new formation of human rights to which having been given an extra-discursive institutional location to defend those rights. If human rights are natural, or God-given, or merely self-evident, then: How is it that made this political and cultural shift toward such protection possible? Where has the urgency come from? To begin to make clear that these are questions, we must think more about the fact that the claim to self-evidence is itself problematic. It is both coherent and curious that the ethical domain that emerged was one that could, at least in principle, challenge and/or transform the sovereignty of the nation-state.

Although the Enlightenment idea of a common human history with cosmopolitan intent and reflections on what conditions would be required to produce "perpetual peace" had been a topic in a longstanding problematicization (most famously in Immanuel Kant), it is only since the fall of the Soviet empire that the virtual global civil society," Ignatieff argues, for the appearance of an "at least motive behind putting rights on the world agenda. The special consciousness of the Holocaust as an utterly singular event only became widespread in the 1960s and 1970s, when the generation after those who had lived through the war came to political consciousness. Peter Novick spells out a similar argument in detail for the United States in his book The Holocaust in American Life. Ignatieff specifies his claim when he asserts that with the fall of the Soviet empire there is now a "single human rights culture in the world." This claim is difficult to concept today raises more questions than it solves. Whatever one wishes to make of, say, pre-contact "Hawaiian culture" after the lengthy, sophisticated, and acrimonious-status and meaning, "rights culture" would certainly have to have a different status. Whatever kind of culture rights discourse is, it certainly must exist and shape people's lives in a manner different manner from "Hawaiian culture."

Not as it is self-evident, as Ignatieff claims, that rights discourses actually do dominate the moral landscape of the human good. Market cultures and religious cultures – to use a shorthand and to trouble the conceit of culture even more – remain potent contenders for the title of who speaks morally, how to speak morally, and what moral speaking is about. Secular rights cultures, cultures of consumption, and a wide range of religious and neo-traditionalist moral discourses, and the symbols licensed by all three, function at times and in specific settings as competitors (or rank enemies), at times and for certain issues as complexly complementary, and at times and for specific issues as simply co-present (or cordoned off one from the other). Claims to hegemony are typical of this moral landscape, but practices of coexistence are equally representative.

Ignatieff points in the direction of this clausiveness and substantive contradiction (or pragmatic flexibility) when he writes that "The legitimacy of human rights is not its authoritative universalism, so much as its capacity to become a moral vernacular for the demand for freedom within local cultures." A moral vernacular? Perhaps, albeit one that derives in part from a highly articulated transnational form that is anything but vernacular. It is obvious that market cultures and religious cultures often are also the vehicle for such moral vernaculars, just as they are themselves transnationally located, a fact that cannot be readily accommodated into a narrative of hope and progress set within the essentially 19th-century grid of modernization and tradition.

Ignatieff remains, as he himself says, a Victorian (whatever such a claim could actually mean). The 19th century, of course, was the time of a triumphant ascendance of nationalism – a time of World's Expositions and international competitions over capital, science, and sovereignty. As if surprised at himself, Ignatieff immediately draws back from his self-characterization as a Victorian when he writes: "Human rights is misconceived if it is understood as a brevity of values: rights talk can do no more than formalize the terms in which conflicts of values are made precise and therefore rendered amenable to compromise and solution. This is their dynamic: they do not, in themselves, resolve arguments: they create the steadily burgeoning case law, which in turn expands the ambit of human rights claims." Rights language is dynamic, destabilizing: it is, in the sense in which Canguilhem and then Foucault used the term, normalizing: "Once rights language exists in public consciousness it sets up a dynamic directed at the inevitable gap between what a society practices and what it preaches." That gap is its engine, its steam, its normativity. Of course, just as "culture" is rather in disrepute as a concept today, so, too, is "society." Societies do not practice anything anymore than they preach. Spokesmen for regimes, ideologies, missions, and pastors preach, not society.

In any event, there is much about this talk of rights that is new; it is generally not autonomous (at least not in the specific forms in which it is being disseminated around the world through a variety of practices – especially international bodies linked to the United Nations and a multitude of NGOs); it is not rooted in the longstanding beliefs, practices, and representations of a defined community. Rather, it would seem to be partly a doctrine and partly a module in what Robert Bellah has
called a "life style enclave" (as a not entirely positive characterization of a trend to self-conscious and de-localized practices stitched together in a form of life that Bellah characterized as "thin"). But newness and "thin-ness" are derogatory only if one thinks that thick and old are better. If one sees the rise, spread, and triumph of "rights talk" as a good thing, then its newness, and perhaps the ready comprehensibility of its core message, would carry with them a positive valence. This positive valuation is one that Bourdieu shares.

Regardless of one's individual judgment of these matters, as human scientists we want to observe how this talk — in fact, a set of discursive and nondiscursive practices — is taking shape. Our imperative is to learn more about the variety and practices of human rights groups as well as the (now visible) preexisting moral landscapes to which the carriers of rights culture bring their message of change and improvement. Although there are governments that contest and combat "rights talk" (and the groups that articulate it) on a variety of grounds, including national sovereignty and traditional culture, it is plausible to argue that currently no secular counter-discourse exists that has anything like the legitimacy, power, and potential for successful expansion that the human rights discourse currently possesses.

Transnational Virtue

A significant move in specifying how one might approach these developments sociologically is made by Yves Dezalay and Bryant Garth, in an article in Pierre Bourdieu's journal, *Actes de la recherche en sciences sociales*, entitled "L'homme et l'alphabétisation hégémonique." They provide a penetrating analysis of recent, seemingly contradictory, developments in the field of human rights: "The movement for human rights is often presented as an exemplary illustration of those new transnational practices that escape from state order. However, by a sort of paradox, it is the national state's recognition of this 'soft law' that represents the fulfillment of the militants' efforts, leading to a growing professionalization and competition within the market of political activism." They see several claims embedded here. First, there is the perfect straightforward and not especially paradoxical point that within a transnational field, national interests, institutions, and players remain significant actors; sovereignty in most domains remains national. Even when it is not absolute, national states and institutions remain faneaux, as it were, through which things must pass on the way in or the way out. Although, as many authors have argued, we are witnessing new relationships between the national and the transnational, this transformation cannot be equated with the definitive eclipse of national sovereignty.

More original is a second claim that there is a market for humanitarians. In their book, *Dealing in Virtue*, Garth and Dezalay provide a detailed account of one example of how a sector of this market — international legal arbitration — came into existence, changed, and how it currently operates. Strikingly, success within the humanitarian market depends on many of the same strategies employed in the venture capital world. These include capturing the attention of various traditional media as well as innovative use of new media (NGOs pioneered the use of the fax machine and then the Internet for political mobilization and the articulation of virtual communities), securing funding from "donors" institutions, translating into position for international conferences and agencies, high mobility of personnel, and so on. One sees a marketing of symbolic capital resources "whose investments and counseling strategy must prepare its clients to overcome the very intense competitions that reign in the market of civic virtue." Following Bourdieu, our authors do not assert that the market of humanitarianism and the capital markets are the same, only that there are parallel principles and forces at work. The analysts' task is to identify those principles and forces as well as to investigate how "capital" from one market is converted into "capital" (or advantage) in another. Garth and Dezalay analyze in some detail the changing players and goals involved in the "diffusion of this new symbolic imperialism." They speak of an "elitist democratic" project, conceived and carried by a small group of "learned men" (English in the text), "destitute of social, progress and civic morality, but very respectful of the interests of big capital whose inheritors, collaborators and beneficiaries they are." The field of these civic engagements and disagreements is a microcosm of the fractures within the ruling class. To invest in civic virtue is also to construct the state and to assure oneself of a position of legitimacy on the international market of savoirs d'état, "state knowledges."}

In *Empire*, Tony Negrí and Michael Hardt make a similar point. They argue that military intervention is only one form of imperial intervention (by imperial they do not mean "imperialist," but the regime of sovereignty that comes after imperialism). Judicial and moral forces provide potent vectors as well. In fact, Negrí and Hardt argue, the softer, "moral" forms are frequently deployed first. Following Weber, we might say that such moral intervention is less costly in both economic and political terms. The most potent new form of such intervention is the so-called nongovernmental organizations (NGOs) which, being nonstate based, are especially well suited to make moral claims. Such humanitarian NGOs as Amnesty International, Oxfam, and Médecins sans frontières (often despite the conscious intentions of their participants) are "some of the most powerful pacific weapons of the new world order. These NGOs conduct 'just wars' without arms, without violence, without borders. Like the Dominicans in the late medieval period and the Jesuits at the dawn of modernity, these groups strive to identify universal needs and defend human rights." Their modern universalism operates both at the level of rights and at the level of the most basic needs of life. It is the key symbol of a growing market of increasing sophistication for protectors of living beings and vital things. Its space is the space of the biopolitical.

For those in the human sciences who would rather refer these grand themes back to historically specific cases and locations, David Rothman, in his book *Strangers at the Bedside*, provides helpful argument and chronology. Rothman shows that the rise of medical ethics boards was not the consequence of the Nuremberg trials. Rather, the lessons of Nuremberg in the United States (and in Europe) were held to be that there was a sharp line cordoning off the pathological from the normal. Nuremberg did not put into question the normal practices or the authority of paternalistic science and
expressions of disappointment in failed hopes for reason — but in the historical fact that "Modern reason, in the form of philosophy, accepted the challenge of the questions, both the great and the all too great, that were bequeathed to it." Bequeathed, that is, by the great systems of Christian theology. Although Blumenberg's book devotes hundreds of erudite pages to demonstrating that the great theological systems were themselves unstable, he nonetheless argues that there had been a proportionality of scale between the type of questions posed and the type of answers provided. That proportionality between problem and response broke down in the 17th century. Yet the former questions (about the nature of being, of logic, of general principles of the cosmos) continued to be posed, and more importantly, accepted as legitimate questions that required an answer. Blumenberg's diagnosis is that modern thinkers "found it impossible to decline to answer questions about the totality of history. To that extent the philosophy of history is an attempt to answer a medieval question with the means available to a post medieval age." The wrong tools for the wrong job.

These broad historical problem-formations and the sequential answers provided constitute Blumenberg's subject matter: "The continuity of history lies not in the permanence of ideal substances but rather in the inheritance of problems." Blumenberg paints a massively detailed portrait of successive articulations of problems, philosophical/theological answers, their failure, displacement, and re-articulation or, in his vocabulary, a history of re-occupations. However, Blumenberg's thesis is not itself a philosophy of history, at least in the traditional sense. He does not see the developments that he chronicles as either unalterable or inevitable — that is, as fatal — for such an attitude would place him squarely in a reoccupation zone that Blumenberg steadfastly refuses to enter. Rather, it is only in later modernity that the long-term pattern of problem-failure-shift—problem has itself become the topic of theoretical curiosity. This new perspective has opened up because, as Blumenberg explains in his section on "The Trial of Theoretical Curiosity," theoretical curiosity, under constant attack from many quarters, has been obliged to question its own legitimacy. As Blumenberg's translator puts it in his introductory remarks, "By questioning the nature of our own questioning, we alter the dynamic of our curiosity not by fiat, by proscribing questions, but by extending it to and satisfying it on another level." In sum, Blumenberg aims at a critical, curative, and affirmative diagnosis. His position is critical in that it seeks to establish through inquiry the contemporary limits of reason; it is curative because if his critical inquiry were to be sustained, a situation would arise in which certain of the current maladies afflicting the practice of reason would disappear; and it is affirmative in that it seeks not to denounce or proscribe reason but to articulate the condition of reason's current legitimacy.

Observing, naming, and analyzing the forms of anthrop is the logo of one type of anthropology. How best to think about the arbitrariness, contingency, and powerful effects of those forms constitutes the challenge of that type of anthropology (understood as Wissenschaft or science). To place oneself midst the relationships of the contending logos (embodied as they are within problematizations, apparatuses, and assemblages) is to find oneself among anthropologies' problems.
John Dewey, "Logic of Judgments of Practice," in Essays in Experimental Logic (New York: Dover, 1916), p. 435. In his "Introduction" (p. 51), Dewey says, "A term is not of course a mere word; a mere word is non-sense, for a sound by itself is not a word at all. Nor is it a mere meaning, which is not even a natural non-sense, being of the kind that is super-normal or transcendentally nonsense. Terms signify that certain aberrant existences are indicated by certain given existences, in the respect that they are abstracted and fixed for intellectual use by some physicallty convenient means, such as a sound or a muscular contraction of the vocal organs."

Foucault identified "'homme moderne' as that being whose politics puts its existence in question." See Michel Foucault, "L'homme moderne est un animal dans la politique duquel sa vie d'être vivant est en question," in La volonté de savoir (Paris: Editions Gallimard, 1979), p. 188.

Dewey, Essays in Experimental Logic, p. 70.

"A critique is not a matter of saying that things are not right as they are. It is a matter of pointing out on what kinds of assumptions, what kinds of familist, unchallenged, unconsidered modes of thought the practices that we accept rest. We must free ourselves from the sacrilisation of the social as the only reality and stop regarding as superfuous something so essential in human life and human relations as thought. Thought exists independently of systems and structures of discourse. It is something that is hidden, but which always animates everyday behavior. There is always a little thought even in the most stupid institutions; there is always thought even in silent habits." Michel Foucault, "Practising Criticism," or "Is it really important to think?" May 30–31, 1981," interview with Didier Erbou, in Foucault: Politics, Philosophy, Culture, Lawrence Kritzman, ed. (New York and London: Routledge, 1988), p. 155.

Dezalay and Garth, "Droits de l'homme," p. 23.

Ibid., p. 27.

Ibid., p. 40.

The general contempt for earlier generations of development theory and practice is widespread in the academic left in the United States. Perhaps for this reason few of these professors and their students seem to realize that they themselves are operating on the inside of an updated version of the enterprise that they are criticizing. In this light, the expansion during the 1990s of post-colonial, transnational, and human rights programs in elite American colleges is consistent. A whole new generation of (post-)modernization professionals is being trained with specialties in environmental, medical, and human rights issues. Dezalay and Garth's analytic apparatus (as well as the analysis of Negri) is especially helpful in making this shift visible. Human rights activism came of respectable academic age toward the end of the 1970s with the crowning success of Amnesty International. Human rights are a cosmopolitan, intellectual, political, and media object. Dezalay and Garth, diligent unmaskers of the dominant, express surprise that some multinational corporations are involved in articulating and funding these discursive networks, in addition to the governments, universities, and NGOs. Their surprise is surprising. It is based in the assumption that ethics or rights or truth is inherently external to forces of capitalism, or domination, of exploitation, of subjugation. Bourdieu knows better. What Dezalay and Garth are reluctant to acknowledge is that their own analytic functions within the market of civic virtue.
