

Worksheet: rotations of

One asked: is there some rotation where by doing it repeatedly we get every rotation?

↳ rotating one face by 90° doesn't work, but maybe some thing fancier?

want $g \in G$ such that $(1, g, g^2, g^3, \dots$

gives every element of G .

$$\langle g \rangle = \{ \dots, g^{-2}, g^{-1}, \overset{\rightarrow g^0 = e = 1 \text{ identity element}}{1}, g, g^2, g^3, \dots \}$$

is called the cyclic subgroup generated by g .

If there were such a $g \in G$, then G would be Abelian:

$$\begin{aligned} g^m \cdot g^n &= (\overbrace{g \cdot g \cdots g}^m) \cdot (\overbrace{g \cdots g}^{n \text{ times}}) \\ &= g^{m+n} \\ &= g^n \cdot g^m \end{aligned}$$

But this group is not Abelian:

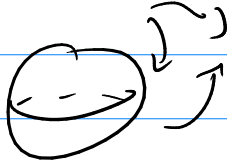

then $hk \neq k \cdot h$

Def the order of a group G
is the # of elements,
or ∞ if the group is infinite.

notation: $|G|$

We'll mostly study finite groups,
but infinite groups are also cool:

e.g. rotations of a sphere 

Def. the order of an element $g \in G$
is the smallest positive integer n
such that $g^n = 1$
or ∞ if there is no such n .

Prop if $|G|$ is finite, then $|g|$ is finite
for every $g \in G$

Proof consider g, g^2, g^3, \dots

if G is finite, they can't all be
different.

So $g^m = g^n$ for some $m \neq n$

if $m < n$, multiply by $g^{-m} = (g^{-1})^m$

$$g^{-m} \cdot g^m = g^{-m} \cdot g^n$$

$$1 = g^{n-m} \quad \text{and } n-m > 0$$

if $m < n$, it's similar.

□

Observation: the order of the element $g \in G$
is the order of the subgroup $\langle g \rangle \subset G$.

Back to $G =$ rotations of a cube.

Saw that $|G| = 24$.

take your favorite face and do a rotation...
6 places it could end up,
4 ways to rotate once it gets there.

or take your fav. vertex
8 places it could go
• 3 orientations once it gets there.

or 12 edges • 2 orientations for an edge

Introduced the symmetric group or permutation group

$S_n = \{ \text{bijections from } \{1, 2, \dots, n\} \text{ to itself.} \}$

$|S_n| = (n \text{ places that } 1 \text{ could go})$
• $((n-1) \text{ places that } 2 \text{ could go})$
• $((n-2) \text{ places that } 3 \text{ could go})$

$= n!$

Not Abelian: if σ is

$$\begin{array}{ccc} 1 & 2 & 3 \\ \swarrow & & \downarrow \\ 2 & & 1 \end{array}$$

and τ is

$$\begin{array}{ccc} 1 & 2 & 3 \\ \downarrow & \searrow & \\ 1 & 2 & 3 \end{array}$$

then $\sigma \circ \tau$ is

$$\begin{array}{ccc} 1 & 2 & 3 \\ \downarrow & \searrow & \downarrow \\ 2 & & 1 \end{array} = \begin{array}{ccc} 1 & 2 & 3 \\ \swarrow & & \downarrow \\ 2 & & 1 \end{array}$$

whereas $\tau \circ \sigma$ is

$$\begin{array}{ccc} 1 & 2 & 3 \\ \swarrow & & \downarrow \\ 2 & & 1 \\ \downarrow & \searrow & \\ 1 & 2 & 3 \end{array} = \begin{array}{ccc} 1 & 2 & 3 \\ \swarrow & & \downarrow \\ 2 & & 1 \end{array}$$

if $G =$ rotations of a cube
and we label the faces 1, 2, 3, 4, 5, 6

then we get a homomorphism

$$G \hookrightarrow S_6$$

$g \longmapsto$ how does g permute the 6 faces?

injective, not surjective

$$24 \hookrightarrow 6! = 720$$

label vertices $1 \dots 8$
get a hom. $G' \hookrightarrow S_8$

label edges $1 \dots 12$
get a hom. $G \hookrightarrow S_{12}$

fun: 4 "long diagonals"

$G \xrightarrow{\quad} S_4$ is it an isomorphism?
24 24

Worksheet: analyze how many elements of each order
in G .
