

# Math 607: Homological Algebra

Tor: what is it good for?

---

## Motivation / Goals

①  $k = \text{field}$

$$R = k[x, y, z]$$

$$I = (y - x^2, z)$$

$$J = (x)$$

transverse

$$R/I \otimes R/J = R/(I+J) = R/(x, y, z)$$

$$\text{Tor}_i^R(R/I, R/J) = 0$$

---

$$J' = (y)$$

not transverse,  
but  $\cap$  is exp. dim.

$$R/I \otimes R/J' = R/(I+J') = R/(x^2, y, z)$$

$$\neq R/(x, y, z)$$

$$\text{Tor}_i^R(R/I, R/J') = 0$$

$$V = (x, y)$$

even less transverse.  
 $\text{codim } 2 \cap \text{codim } 2$   
 $= \text{codim } 3 < 4$

$$\mathbb{R}/\mathbb{I} \otimes \mathbb{R}/\mathbb{K} = \mathbb{R}/(\mathbb{I} + \mathbb{K}) = \mathbb{R}/(x, y, z)$$

$$\text{Tor}_1^{\mathbb{R}}(\mathbb{R}/\mathbb{I}, \mathbb{R}/\mathbb{K}) = \mathbb{R}/(x, y, z)$$

$$\text{Tor}_2 = 0$$

---

$$\mathbb{R}/\mathbb{K} \otimes \mathbb{R}/\mathbb{K} = \mathbb{R}/\mathbb{K}$$

$$\text{codim } 2 \cap \text{codim } 2 = \text{codim } 2 < 4$$

$$\text{Tor}_1(\mathbb{R}/\mathbb{K}, \mathbb{R}/\mathbb{K}) = (\mathbb{R}/\mathbb{K})^2$$

$$\text{Tor}_2 = \mathbb{R}/\mathbb{K}$$

$$\text{Tor}_3 = 0$$

---

In general, if  $\mathbb{I}, \mathbb{J} \subset \mathbb{C}[x, \dots, x_n]$

cut out  $X, Y \subset \mathbb{C}^n$  smooth

From:  $\text{codim}(X \cap Y) \leq \text{codim } X + \text{codim } Y$   
difference tells the last  
non-zero  $\text{Tor}_i(\mathbb{R}/\mathbb{I}, \mathbb{R}/\mathbb{J})$ .

②  $R =$  Noetherian comm. ring.

$M =$  f.i.h. gen. module

proj dim  $(M) =$  length of shortest projective resolution

glob. dim  $(R) = \max(\text{proj dim}(\text{modules}))$

Serre: glob dim  $< \infty$  iff  $R$  is regular

if  $k = \bar{k}$  and  $R = k[x_1, \dots, x_n]/I$

then regular  $\Leftrightarrow$  smooth

but  $\mathbb{Z}$  is also regular

$\mathbb{Z}[\sqrt{-5}]$  is regular

$\mathbb{Z}[\sqrt{3}]$  is not...

$\mathbb{Z}\left[\frac{1+\sqrt{-3}}{2}\right]$  is.
