

Record the equation of the fit line, and compare the value of the slope, m , to the acceleration you found in Activity 2-1.

Question E2-6: What is the physical meaning of b ?

Question E2-7: How do the two values of acceleration that you found in this extension agree with each other? Is this what you expected?

Find the average acceleration for the motion in your **SPEEDUP2.XXX** file from the acceleration–time and velocity–time graphs using the same methods. Compare the values to those found in Activity 2-2 by averaging 10 values.

INVESTIGATION 3: SLOWING DOWN AND SPEEDING UP

In this investigation you will look at a cart moving along a ramp or other level surface *and slowing down*. A car being driven down a road and brought to rest when the brakes are applied is a good example of this type of motion.

Later you will examine the motion of the cart *toward* the motion detector and *speeding up*.

In both cases, we are interested in how velocity and acceleration change over time. That is, we are interested in the shapes of the velocity–time and acceleration–time graphs (and their relationship to each other), as well as the vectors representing velocity and acceleration.

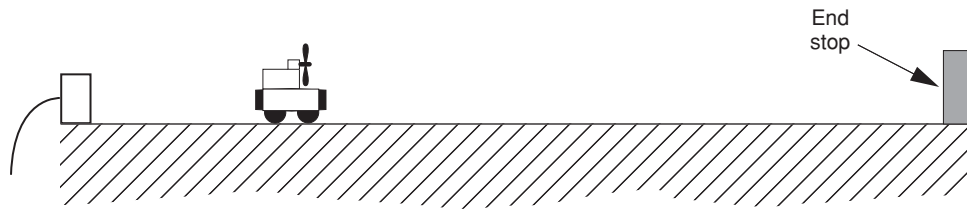

You will need the following materials:

- computer-based laboratory system
- motion detector
- *RealTime Physics Mechanics* experiment configuration files
- cart with very little friction
- smooth ramp or other level surface 1.2–2.5 m long
- fan unit attachment with batteries

Activity 3-1: Slowing Down

In this activity you will look at the velocity and acceleration graphs of the cart moving *away from* the motion detector and *slowing down*.

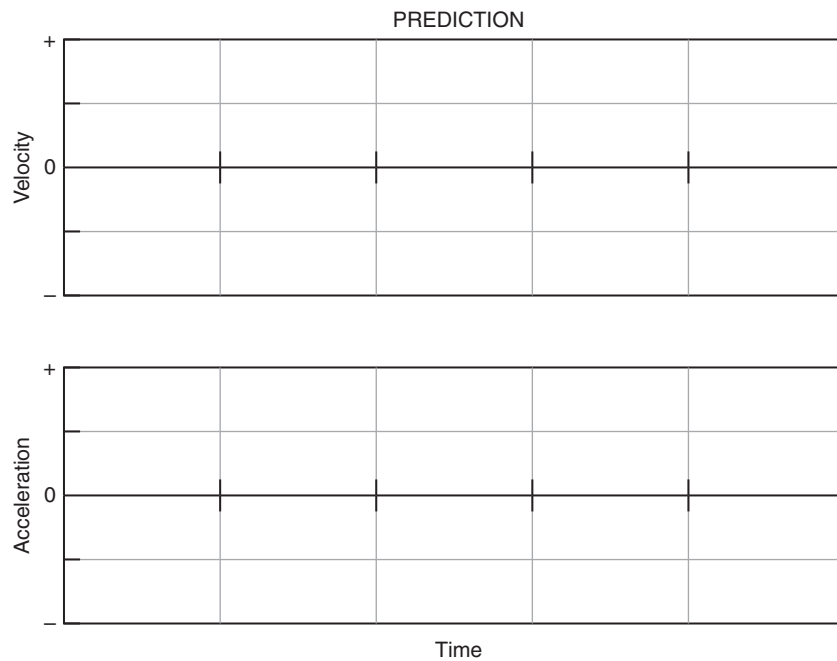

1. The cart, ramp, and motion detector should be set up as in Investigation 1. Use the maximum number of batteries (or set the dial to the maximum speed). The fan should be pushing the cart *toward* the motion detector.

Now, when you give the cart a quick push away from the motion detector with the fan running, it will slow down after it is released.

Prediction 3-1: If you give the cart a short push away from the motion detector and release it, will the acceleration be positive, negative, or zero (after it is released)?

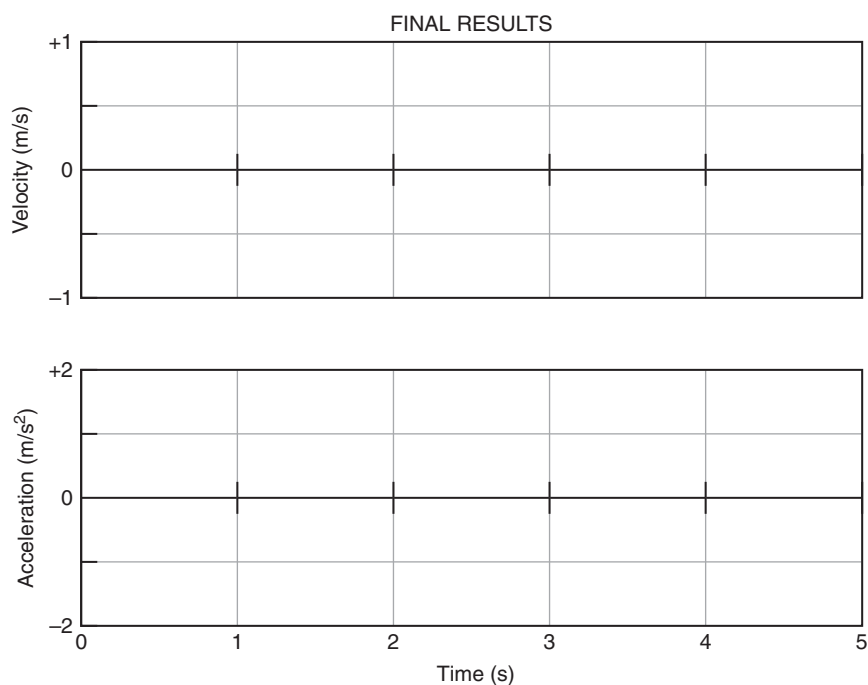

Sketch your predictions for the velocity–time and acceleration–time graphs on the axes below.

2. Test your predictions. Open the experiment file called **Slowing Down (L02A3-1)** to display the velocity–time and acceleration–time axes that follow.
3. **Begin graphing** with the back of the cart at least the minimum specified distance away from the motion detector. Turn the fan unit on, and when you begin to hear the clicks from the motion detector, give the cart a gentle push away from the detector so that it comes to a stop near the end of the ramp. *(Be sure that your hand is not between the cart and the detector.) Stop the cart with your hand—do not let it return toward the motion detector—and turn the fan unit off immediately to save the batteries.*

You may have to try a few times to get a good run. Don't forget to **change the axes** if this will make your graphs easier to read.

Move your data so that the graphs are **persistently displayed on the screen**.

4. Neatly sketch your results on the previous axes, or **print** the graphs and affix them over the axes.

Label your graphs with

- A at the spot where you started pushing.
- B at the spot where you stopped pushing.
- C the region where only the force of the fan is acting on the cart.
- D at the spot where the cart came to rest (and you stopped it with your hand).

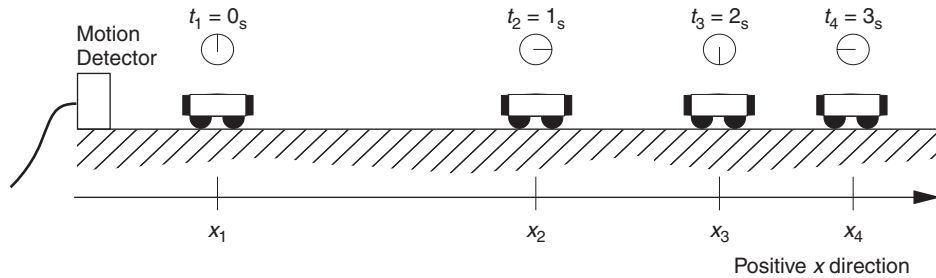

Also sketch on the same axes the velocity and acceleration graphs for *Speeding Up 2* from Activity 1-2.

Question 3-1: Did the shapes of your velocity and acceleration graphs agree with your predictions? How can you tell the sign of the acceleration from a velocity–time graph?

Question 3-2: How can you tell the sign of the acceleration from an acceleration–time graph?

Question 3-3: Is the sign of the acceleration (which indicates its direction) what you predicted? How does *slowing down* while moving *away* from the detector result in this sign of acceleration? (**Hint:** Remember that acceleration is the *rate of change* of velocity with respect to time. Look at how the velocity is changing.)

Question 3-4: The diagram below shows the positions of the cart at equal time intervals. (This is like overlaying snapshots of the cart at equal time intervals.) At each indicated time, sketch a vector above the cart that might represent the velocity of the cart at that time while it is moving away from the motion detector and slowing down. Assume that the cart is moving at t_1 and t_4 .

Question 3-5: Show below how you would find the vector representing the change in velocity between the times 2 and 3 s in the diagram above. (Remember that the change in velocity is the final velocity minus the initial velocity.)

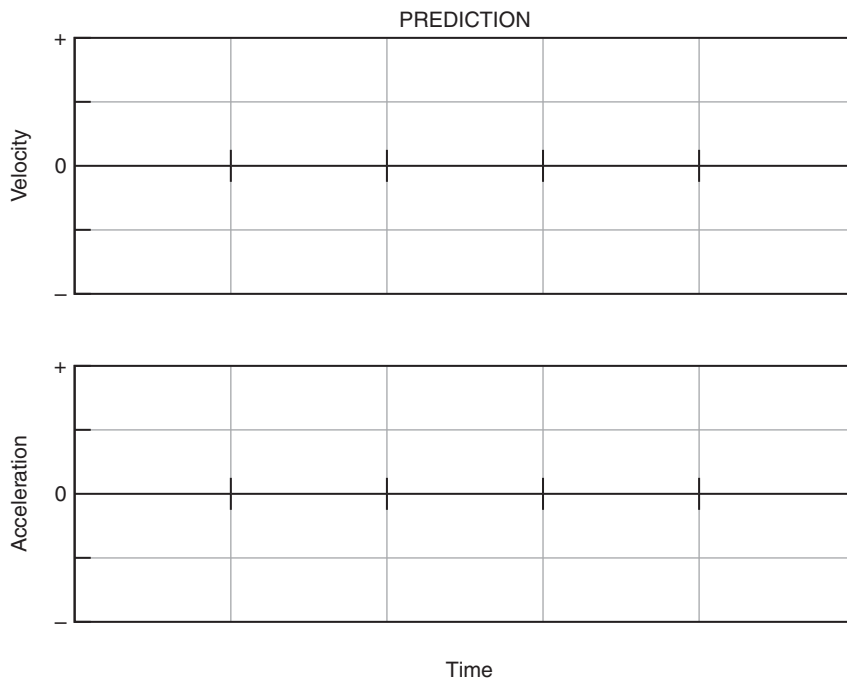

Based on the direction of this vector and the direction of the positive x axis, what is the sign (the direction) of the acceleration? Does this agree with your answer to Question 3-3?

Question 3-6: Based on your observations in this lab, state a general rule to predict the sign (the direction) of the acceleration if you know the sign of the velocity (i.e., the direction of motion) and whether the object is speeding up or slowing down.

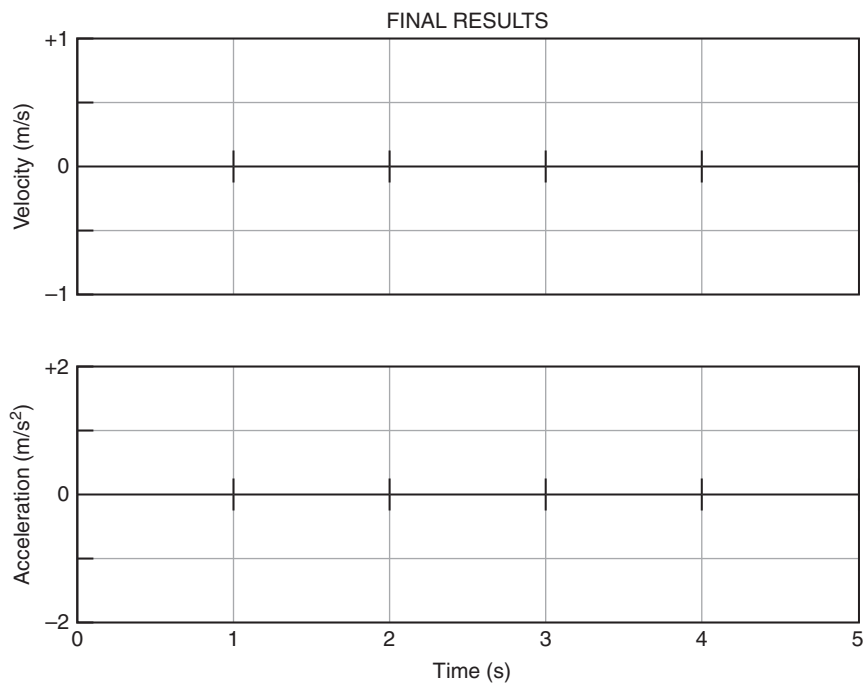

Activity 3-2 Speeding Up Toward the Motion Detector

Prediction 3-2: Suppose now that you start with the cart at the far end of the ramp, and let the fan push it *toward* the motion detector. As the cart moves toward the detector and speeds up, predict the direction of the acceleration. Will the sign (direction) of the acceleration be positive or negative? (Use your general rule from Question 3-6.)

Sketch your predictions for the velocity–time and acceleration–time graphs on the axes that follow.

1. Test your predictions. First **clear** any previous graphs. **Graph velocity first.** Graph the cart moving *toward* the detector and *speeding up*. Turn the fan unit on, and when you hear the clicks from the motion detector, release the cart from rest from the far end of the ramp. (*Be sure that your hand is not between the cart and the detector.*) *Stop the cart before it reaches the minimum specified distance from the motion detector, and turn the fan unit off immediately.*
2. Sketch these graphs or **print** and affix on the axes below. Label these graphs as “Speeding Up Moving Toward.”

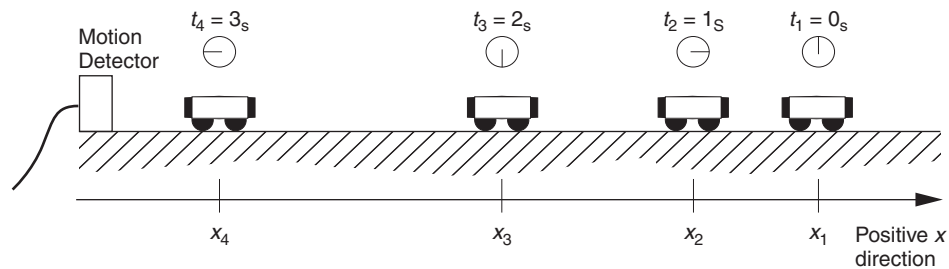

Question 3-7: How does your velocity graph show that the cart was moving *toward* the detector?

Question 3-8: During the time that the cart was speeding up, is the acceleration positive or negative? Does this agree with your prediction? Explain how *speeding up* while moving *toward* the detector results in this sign of acceleration. (**Hint:** Look at how the velocity is changing.)

Question 3-9: When an object is speeding up, what must be the direction of the acceleration relative to the direction of the object's velocity? Are they in the same or different directions? Explain.

Question 3-10: The diagram shows the positions of the cart at equal time intervals. At each indicated time, sketch a vector above the cart that might represent the velocity of the cart at that time while it is moving toward the motion detector and speeding up. Assume that the cart is already moving at t_1 .

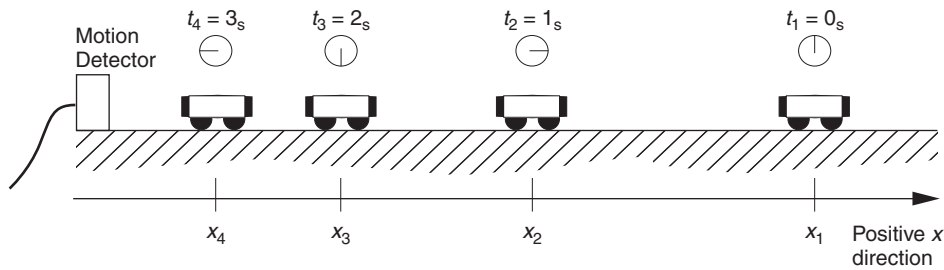

Question 3-11: Show below how you would find the vector representing the change in velocity between the times 2 and 3 s in the diagram above. Based on the direction of this vector and the direction of the positive x axis, what is the sign of the acceleration? Does this agree with your answer to Question 3-8?

Question 3-12: Was your general rule in Question 3-6 correct? If not, modify it and restate it here.

Question 3-13: There is one more possible combination of velocity and acceleration directions for the cart: moving *toward* the detector and *slowing down*. Use your general rule to predict the direction and sign of the acceleration in this case. Explain why the acceleration should have this direction and this sign in terms of the sign of the velocity and how the velocity is changing.

Question 3-14: The diagram shows the positions of the cart at equal time intervals for the motion described in Question 3-13. At each indicated time, sketch a vector above the cart that might represent the velocity of the cart at that time while it is moving toward the motion detector and slowing down. Assume that the cart is moving at t_1 and t_4 .

Question 3-15: Show how you would find the vector representing the change in velocity between the times 2 and 3 s in the diagram above. Based on the direction of this vector and the direction of the positive x axis, what is the sign of the acceleration? Does this agree with your answer to Question 3-13?

If you have more time, do the following Extension.

Extension 3-3: Graphing Slowing Down Toward the Motion Detector

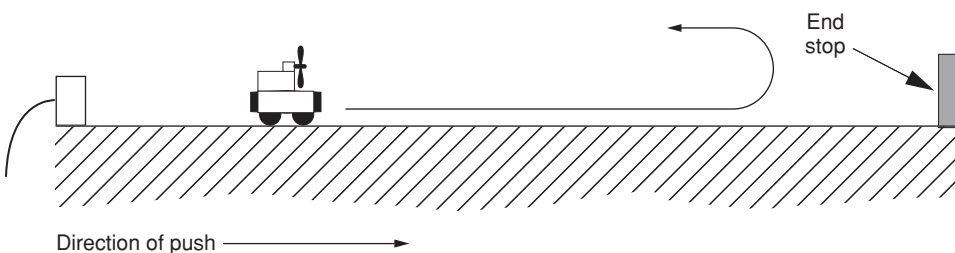

Use the motion detector setup to graph the motion of the cart moving *toward* the motion detector and *slowing down*, as described in Question 3-13. **Print** and affix the graph.

Question E3-16: Compare the graphs to your answers to Questions 3-13 to 3-15.

Activity 3-4: Reversing Direction

In this activity you will look at what happens when the cart slows down, reverses its direction, and then speeds up in the opposite direction. How does the velocity change with time? What is the cart's acceleration?

The setup should be as shown below—the same as before. The fan unit should have the maximum number of batteries and should be attached securely to the cart.

Prediction 3-3: You start the fan and give the cart a push *away* from the motion detector. It moves away, slows down, reverses direction, and then moves back

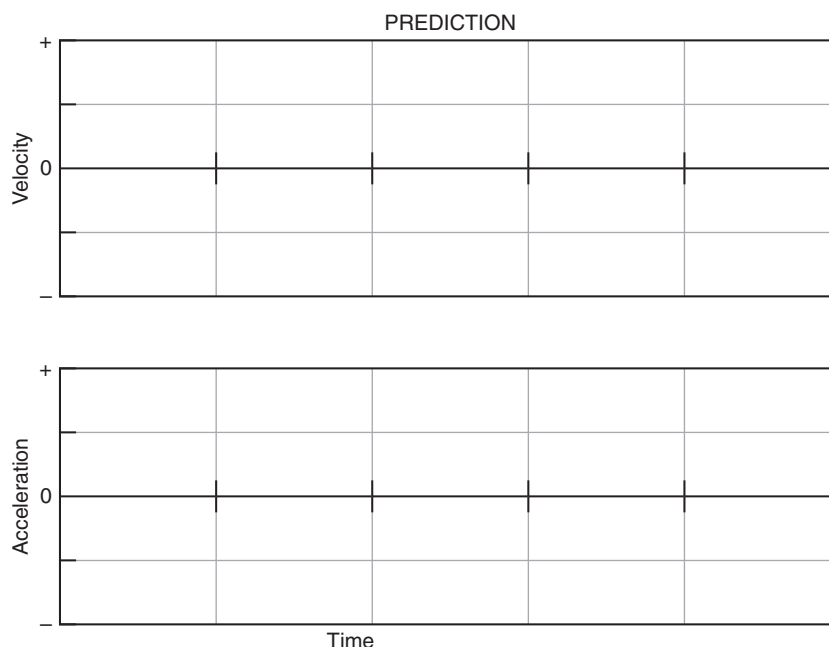

toward the detector. Try it without using the motion detector! *Be sure to stop the cart before it hits the motion detector, and turn the fan off immediately.*

For each part of the motion—*away from the detector, at the turning point, and toward the detector*—indicate in the table below whether the velocity is positive, zero, or negative. Also indicate whether the acceleration is positive, zero, or negative.

PREDICTION TABLE

	Moving away	At the turning point	Moving toward
Velocity			
Acceleration			

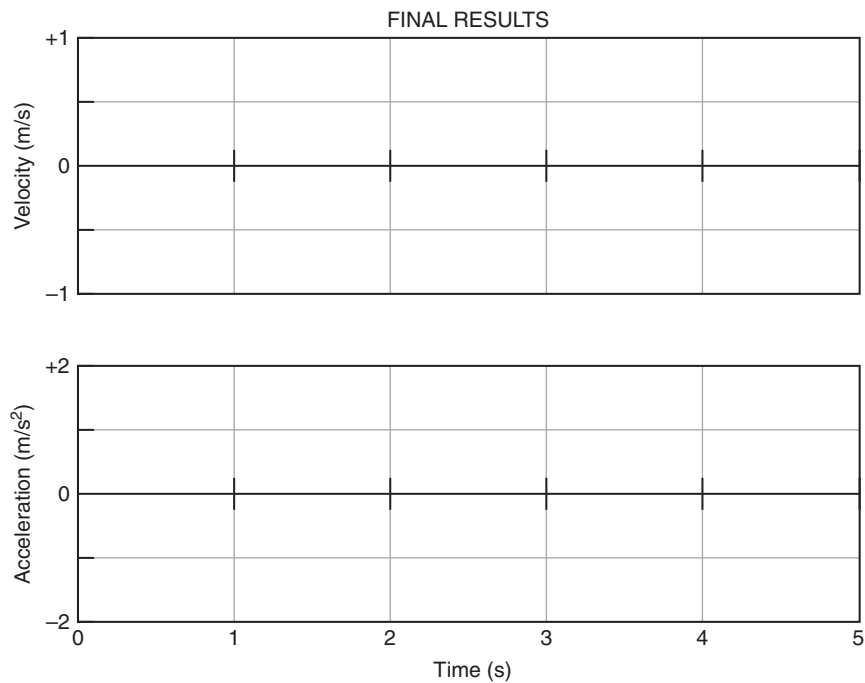

Prediction 3-4: On the axes that follow sketch your predictions of the velocity–time and acceleration–time graphs of this entire motion.

Note: Steps 1-2 have been done for you. To view a video of the experiment and the data collection for v and a , using a motion sensor, [click HERE](#).

1. Test your predictions. Set up to graph velocity and acceleration on the following graph axes. (Open the experiment file called **Slowing Down (L02A3-1)** if it is not already opened.)
2. **Begin graphing** with the back of the cart near at least the minimum specified distance from the motion detector. Turn on the fan unit, and when you begin to hear the clicks from the motion detector, give the cart a gentle push away from the detector so that it travels at least 1 m, slows down, and then reverses its direction and moves toward the detector. (*Push and stop the cart with your hand on its side. Be sure that your hand is not between the cart and the detector.*)
Be sure to stop the cart at least the minimum distance from the motion detector and turn off the fan unit immediately.

You may have to try a few times to get a good round trip. Don't forget to change the scales if this will make your graphs clearer.

3. When you get a good round trip, sketch both graphs on the axes above or **print** and affix over the axes.

Question 3-17: Label *both* graphs with

- A where the cart started being pushed.
- B where the push ended (where your hand left the cart).
- C where the cart reached its turning point (and was about to reverse direction).
- D where you stopped the cart with your hand.

Explain how you know where each of these points is.

Question 3-18: Did the cart “stop” at its turning point? (**Hint:** Look at the velocity graph. What was the velocity of the cart at its turning point?) Does this agree with your prediction? How much time did it spend at the turning point velocity before it started back toward the detector? Explain.

Question 3-19: According to your acceleration graph, what is the acceleration at the instant the cart reaches its turning point? Is it positive, negative, or zero? Is it significantly different from the acceleration during the rest of the motion? Does this agree with your prediction?

Question 3-20: Explain the observed sign of the acceleration at the turning point. (**Hint:** Remember that acceleration is the *rate of change* of velocity. When the cart is at its turning point, what will its velocity be in the next instant? Will it be positive or negative?)

Question 3-21: On the way back toward the detector, is there any difference between these velocity and acceleration graphs and the ones that were the result of the cart starting from rest (Activity 3-2)? Explain.

If you have more time, do the following Extension.

Extension 3-5: Sign of Push and Stop

Find on your acceleration graphs for Activity 3-4 the time intervals when you pushed the cart to start it moving and when you stopped it.

Question E3-22: What is the sign of the acceleration for each of these intervals? Explain why the acceleration has this sign in each case.

Challenge: You throw a ball up into the air. It moves upward, reaches its highest point, and then moves back down toward your hand. Assuming that upward is the positive direction, indicate in the table that follows whether the velocity is positive, zero, or negative during each of the three parts of the motion. Also indicate if the acceleration is positive, zero, or negative. (**Hint:** Remember that to find the acceleration, you must look at the *change* in velocity.)

	Moving up <i>after release</i>	At highest point	Moving down
Velocity			
Acceleration			

[Click HERE to view a video of a tossed ball with the v and a graphs from video analysis.](#)

Question 3-23: In what ways is the motion of the ball similar to the motion of the cart that you observed in Activity 3-4? What causes the ball to accelerate?

HOMEWORK FOR LAB 2: CHANGING MOTION

1. An object moving along a line (the + position axis) has the acceleration–time graph on the right.

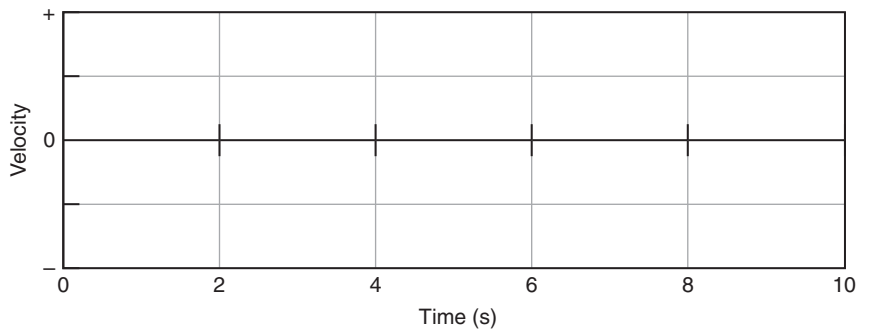

- a. Describe how the object might move to create this graph if it is moving away from the origin.

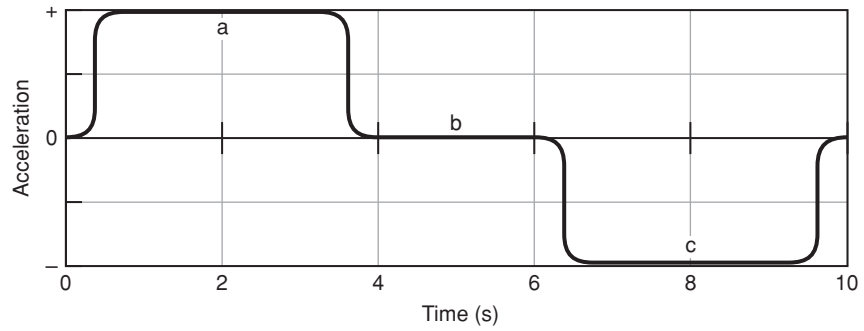

- b. Describe how the object might move to create this graph if it is moving toward the origin.

- c. Sketch with a solid line on the axes on the right a velocity–time graph that goes with the motion described in (a).

- d. Sketch with a dashed line on the axes on the right a velocity–time graph that goes with the motion described in (b).

2. How would an object move to create each of the three labeled parts of the acceleration–time graph shown below?

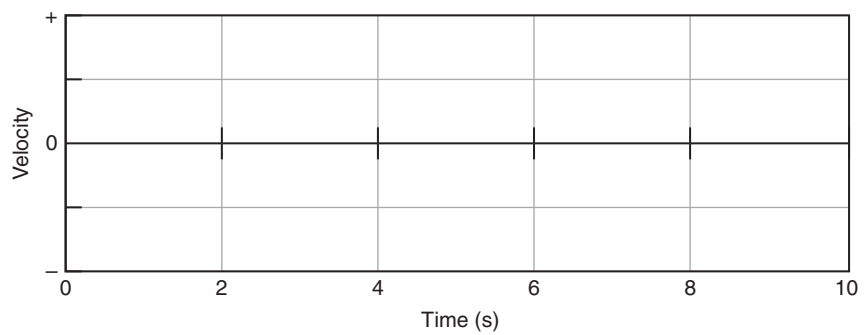

a:

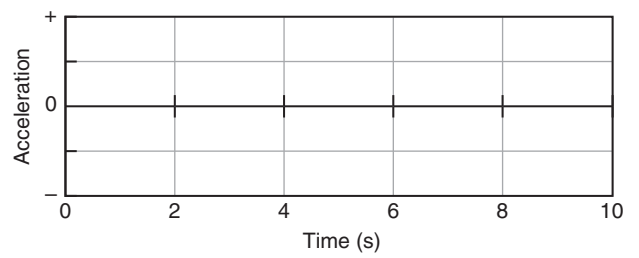

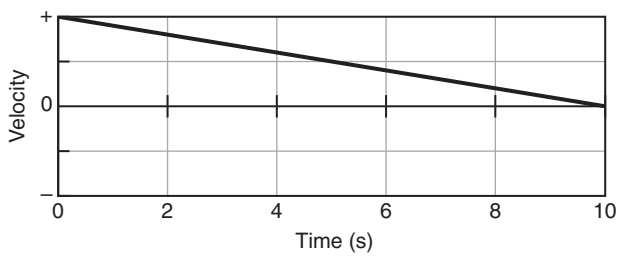

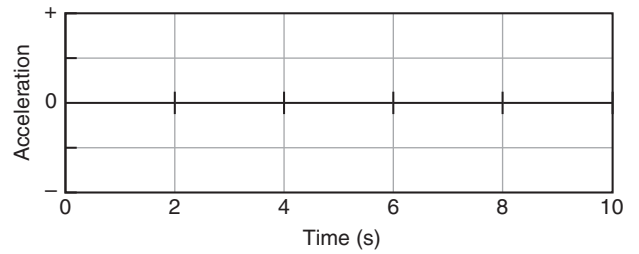

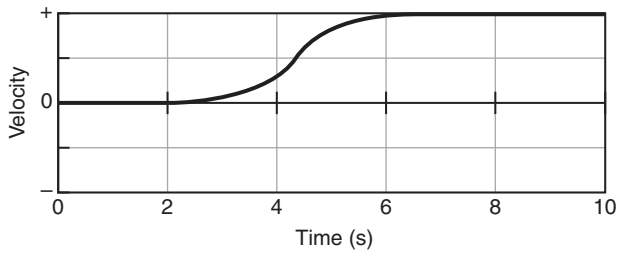

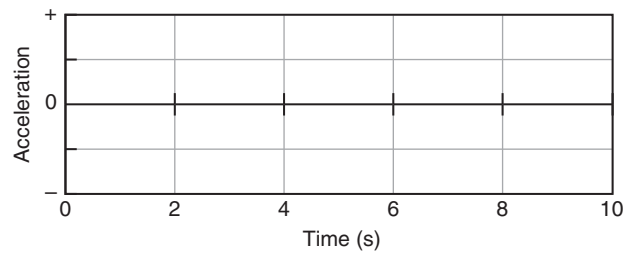

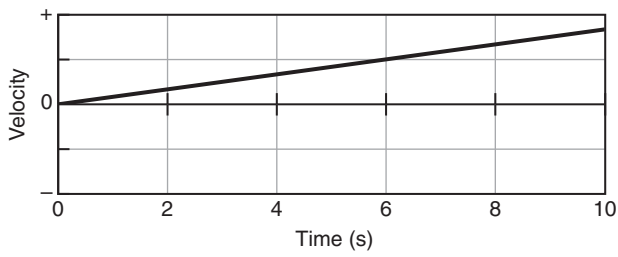

b:

c:

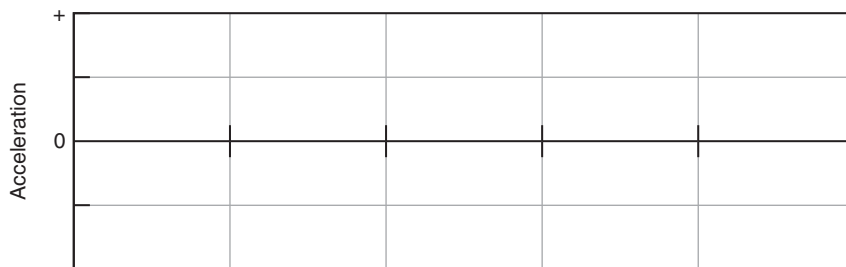

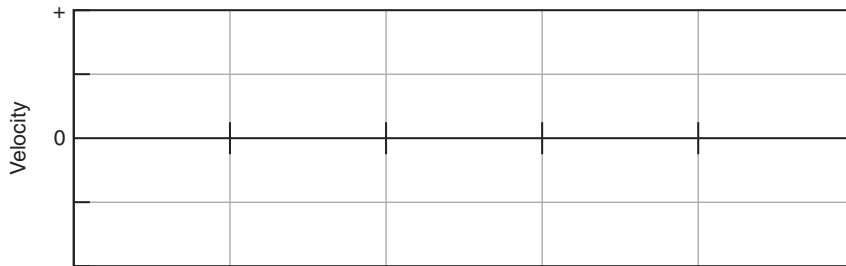

3. Sketch below a velocity–time graph that might go with the acceleration–time graph in Question 2.

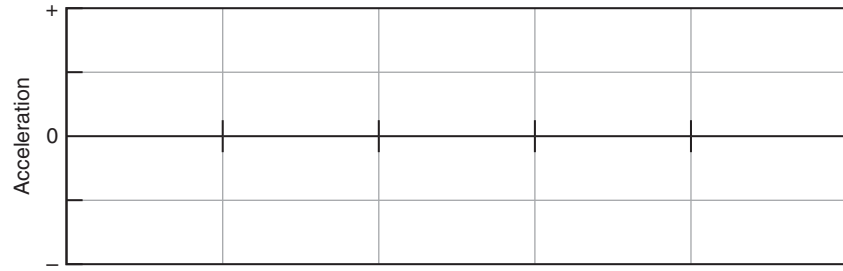

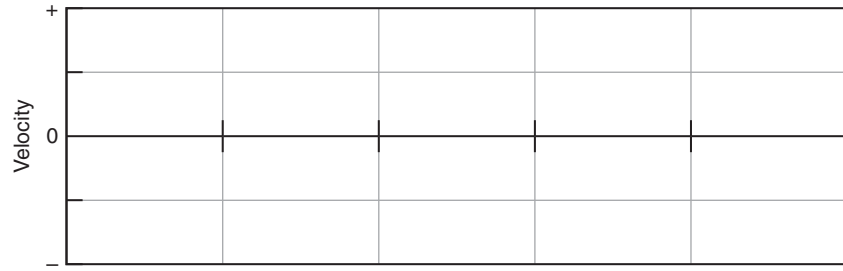

4. For each of the velocity–time graphs that follow, sketch the shape of the acceleration–time graph that goes with it.

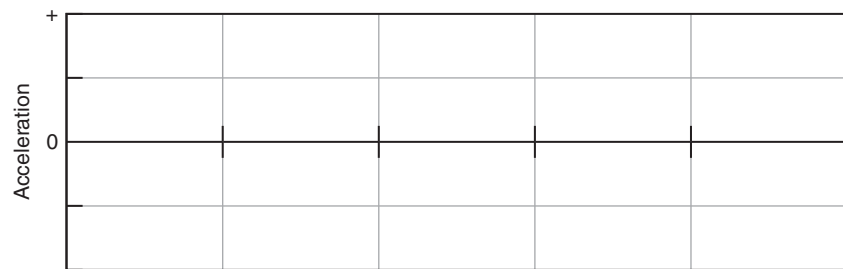

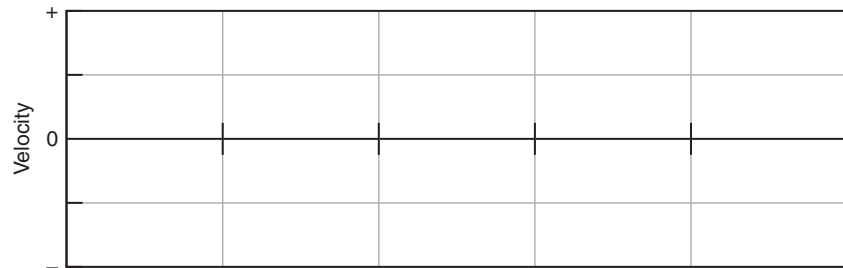

5. A car can move along a line (the + position axis). Sketch velocity-time and acceleration-time graphs that correspond to each of the following descriptions of the car's motion.
- The car starts from rest, and moves away from the origin, increasing its speed at a steady rate.

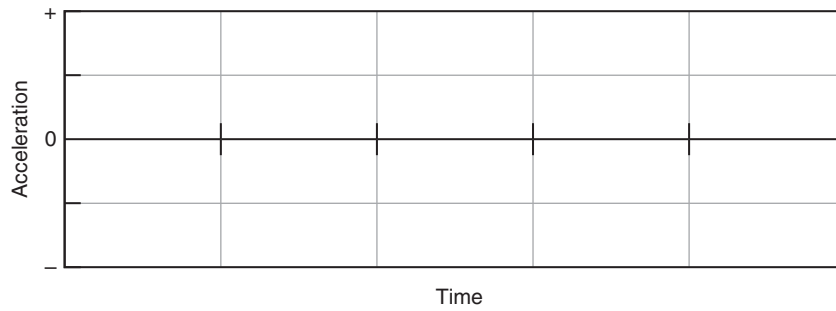

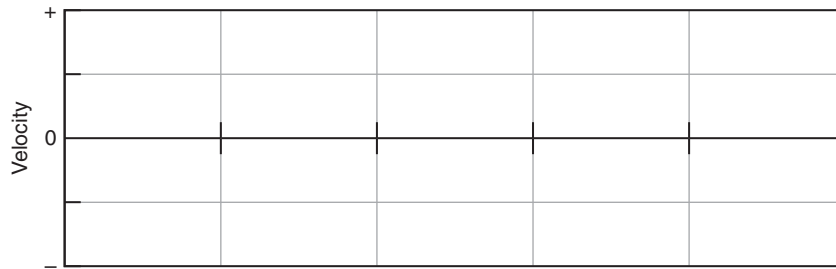

- b. The car is moving away from the origin at a constant velocity.

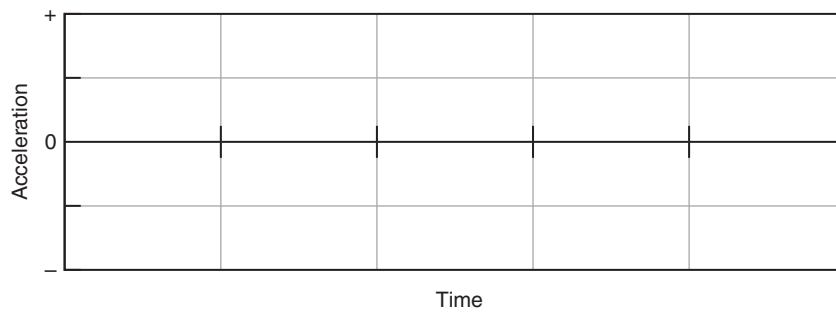

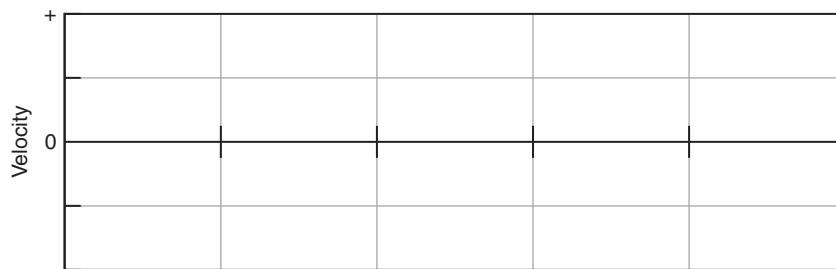

- c. The car starts from rest, and moves away from the origin, increasing its speed at a steady rate twice as large as in (a) above.

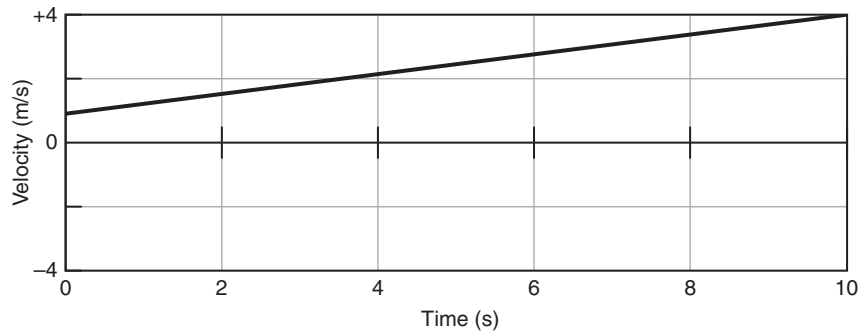

- d. The car starts from rest, and moves toward the origin, increasing its speed at a steady rate.

- e. The car is moving toward the origin at a constant velocity.

6. The following is a velocity–time graph for a car.

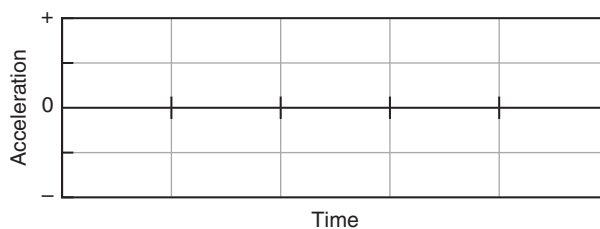

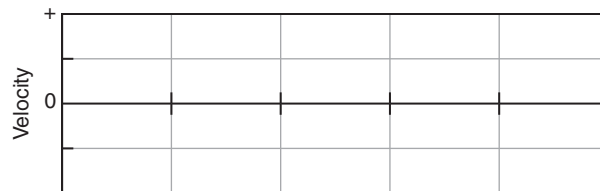

What is the average acceleration of the car? Show your work below.

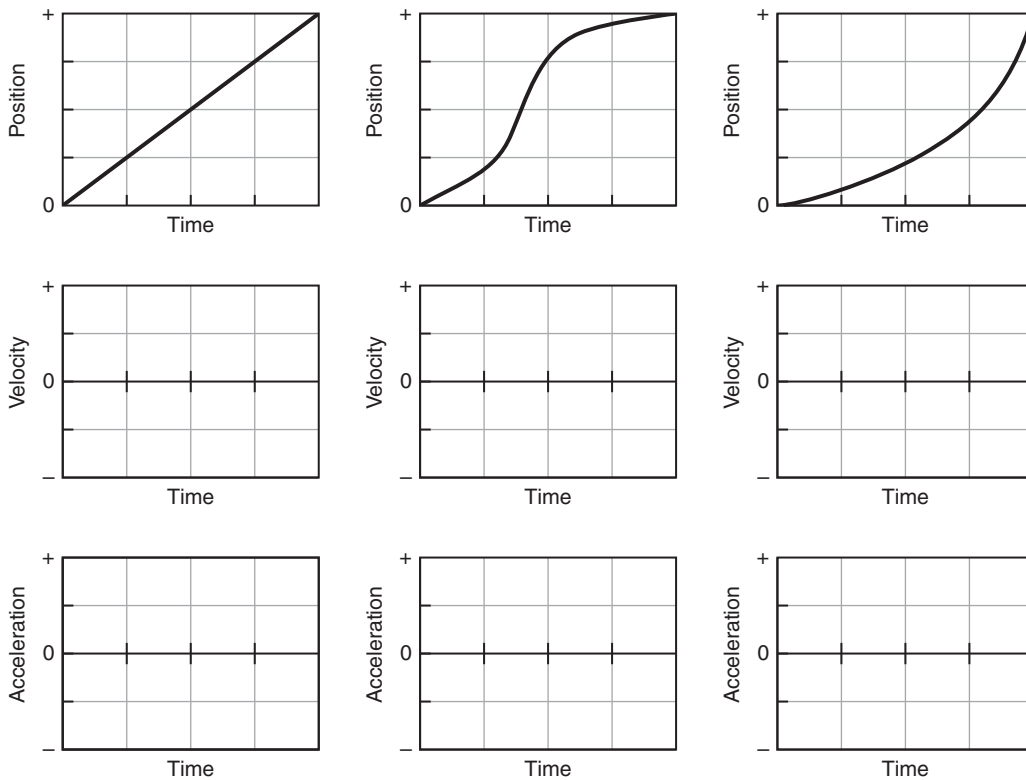

7. A car moves along a line (the + position axis). Fill in the table below with the sign (+ or –) of the velocity and acceleration of the car for each of the motions described.

	Position	Velocity	Acceleration when speeding up	Acceleration when slowing down
Car moves away from the origin	+			
Car moves toward the origin	+			

8. A ball is tossed in the air. It moves upward, reaches its highest point, and falls back downward. Sketch a velocity–time and an acceleration–time graph for the ball from the moment it leaves the thrower’s hand until the moment just before it reaches her hand again. Consider the positive direction to be *upward*.

9. For each of the position–time graphs shown, sketch below it the corresponding velocity–time and acceleration–time graphs.

(a)

(b)

(c)

10. Each of the pictures below represents a car moving down a road. The motion of the car is described. In each case, draw velocity and acceleration vectors above the car that might represent the described motion. Label the vectors. Also specify the sign of the velocity and the sign of the acceleration. (The positive position direction is toward the right.)

The driver has stepped on the accelerator, and the car is just starting to move forward.

Sign of velocity:

Sign of acceleration:

The car is moving forward. The brakes have been applied. The car is slowing down, but has not yet come to rest.

Sign of velocity:

Sign of acceleration:

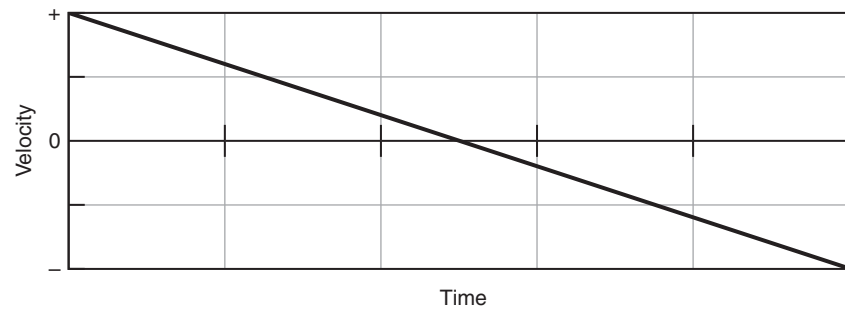

The car is moving backward. The brakes have been applied. The car is slowing down, but has not yet come to rest.

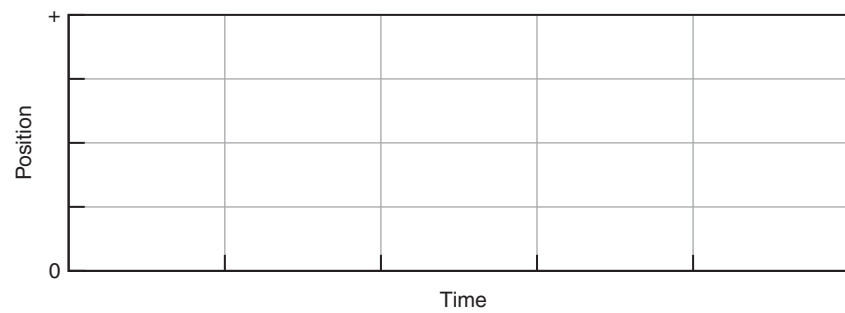

Sign of velocity:

Sign of acceleration:

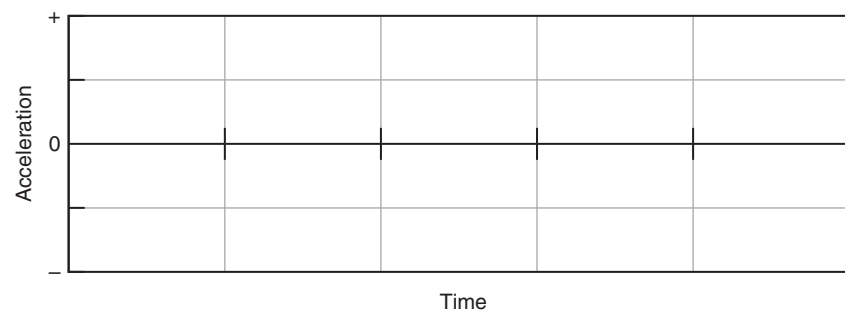

11. a. Describe how you would move to produce the velocity–time graph below.

- b. Sketch a position–time graph for this motion on the axes below.

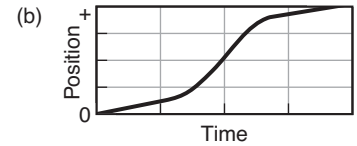

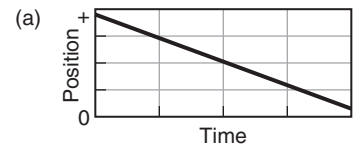

- c. Sketch an acceleration–time graph for this motion on the axes below.

The graphs on this page represent the motion of objects along a line that is the positive position axis. Notice that the motion of objects is represented by position, velocity, or acceleration graphs.

Answer the following questions. You may use a graph more than once or not at all, and there may be more correct choices than blanks. If none of the graphs is correct, answer J.

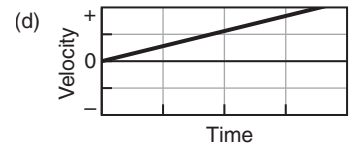

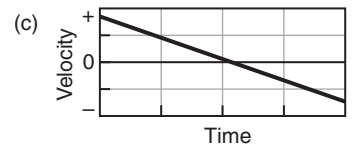

_____ 12. Pick one graph that gives enough information to indicate that the velocity is always negative.

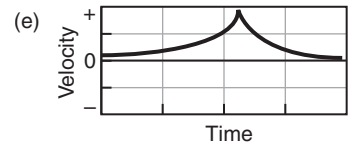

Pick three graphs that represent the motion of an object whose velocity is constant (not changing).

_____ 13. _____ 14. _____ 15.

_____ 16. Pick one graph that *definitely indicates* an object has reversed direction.

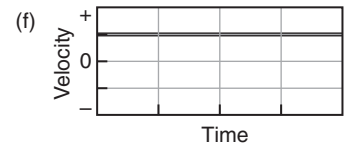

_____ 17. Pick one graph that might possibly be that of an object standing still.

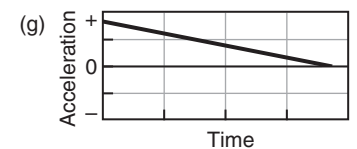

Pick 3 graphs that represent the motion of objects whose acceleration is changing.

_____ 18. _____ 19. _____ 20.

Pick a velocity graph and an acceleration graph that could describe the motion of the same object during the time shown.

_____ 21. Velocity graph.

_____ 22. Acceleration graph.
