TUBULAR FURNACES

Astro Industries pioneered in the design and manufacture of high-temperature and controlled atmosphere furnaces, and now also manufactures laboratory tubular furnace systems for operation at temperatures to 1700°C in air. There are over two hundred single-zone models in six temperature ranges. Accessories include furnace support stands, temperature controls, and power supplies. A complete furnace system can be selected from this catalogue. Please refer to the last page. Numerous custom options and accessories are also available and will be quoted on request.

Astro tubular furnaces are designed to provide good temperature stability and efficient steady state power consumption. Typical heat up time to maximum temperature is approximately two hours.

Other outstanding performance features include:

■ **TEMPERATURE PROFILES**

Shunt tapped heating elements permit adjustment of the temperature profile.

■ **TEMPERATURE UNIFORMITIES**

Uniform temperature zones with tolerances of $\pm 1^\circ\text{C}$ and better are possible.

■ **COVERED SHUNT PANELS**

The completely covered shunt panel is sized to afford ample space for shunt wires. No shunts or power connections are exposed during operation.

■ **HORIZONTAL OR VERTICAL OPERATION**

All models can be operated either vertically or horizontally.

TUBULAR FURNACES

TEMPERATURE CAPABILITIES

- **A100 SERIES** — 1100°C (2000°F)
Heating element is nickel-chromium wire, wound on a high-purity, fused aluminum oxide tube.
- **A200 SERIES** — 1200°C (2200°F)
Iron-chromium-aluminum wire, wound on a high-purity fused aluminum oxide tube.
- **A300 SERIES** — 1315°C (2400°F)
Internally exposed iron-chromium-aluminum ribbon heating element, supported and separated by aluminum oxide spacers.
- **A400 SERIES** — 1430°C (2600°F)
Four-strand platinum 50% rhodium wire, wound on a high-purity, fused aluminum oxide tube.
- **A500 SERIES** — 1550°C (2800°F)
Four-strand platinum 50% rhodium wire, wound on a recrystallized 99.8% aluminum oxide tube.
- **A700 SERIES** — 1700°C (3100°F)
Nine-strand platinum 50% rhodium wire wound on a recrystallized 99.8% aluminum oxide tube.

TEMPERATURE UNIFORMITIES

The length and uniformity of the constant temperature zone in any furnace is based on a ratio of furnace heated length to bore diameter and the amount of shunting done. The tubular furnace heating element is a coil of resistance wire. Shunt leads are spaced along the length of the heating element at calculated intervals. Terminals located on the shunt panel, and connected to the shunt leads, permit attaching resistance wire or variable resistors between shunt leads to adjust the temperature profile inside the furnace.

Typically, profile adjustments are made by shunting. A shunt between two shunt leads establishes a current path in parallel with a segment of the element, decreasing the effective resistance of that area. This decreases the total resistance of the element and causes more current to flow through the entire element. Thus, the non-shunted segments increase and the shunted segment decreases in temperature. Since the achievement of a uniform zone is usually accomplished in this manner the maximum uniform zone temperatures obtainable should be estimated at 50-100° C less than the maximum temperature rating of the furnace.

Although general rules of thumb can be applied in determining the uniformities achievable in most furnaces, the rules do vary with operating conditions. In establishing guidelines, we have assumed either horizontal or vertical operation and that the ends of the furnace are closed. The factory should be consulted if actual conditions deviate significantly from assumed parameters. All formulas pertain to an empty furnace, but the addition of work to a furnace will normally improve uniformity.

The following can be used in determining the heated length required (in A100, A200, A400, A500, A700 Series furnaces) to achieve a given uniformity with furnace horizontal and the ends closed. For ±1° C add the length of 4 bore diameters to the uniform zone desired. For ±5° C add 3 bore diameters to the uniform zone, and add 2 bore diameters to the uniform zone for ±10° C.

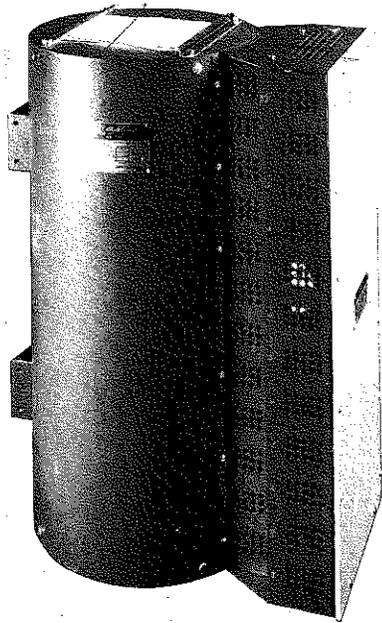

For vertical operation (with furnace ends closed) add the length of one bore diameter to the lengths indicated for horizontal operation.

Since the A300 Series element windings cannot be varied, a slightly different formula applies. For a uniformity of ±1.5-3.0° C add the length of 4 bore diameters to the uniform zone if a Tri-One transformer is used. Add 6 bore diameters if other than a Tri-One transformer is to be used. For tolerances of ±5-10° C the same rules can be used as for wire wound furnaces. For vertical operation of an A300 Series, and/or a uniformity of ±1° C or better, a three-zone design is recommended.

CONSTRUCTION

Construction features in all standard furnaces include: full-length thermocouple well immediately adjacent to the heating element and accessible from either end; external mounting blocks located 180° from the shunt panel; sliding covers on both ends of the furnace; durable texture painted shell; and a 10-foot long power cord. Insulation is either aluminum oxide wool (A100 through A400 Series) or a combination of aluminum oxide bubble and wool. The shunt panel can be removed easily to facilitate maintenance and element replacement. The platinum furnaces have a fuse to safeguard the element against high current inrush.

In the A400, A500, and A700 Series, where a heating element would require in excess of 230 volts, the continuous element winding has a center power lead to permit operation of the furnace at less than 230 volts. A "CT" in the Hot Voltage column of the Furnace Model Tables indicates a center power lead.

OPTIONS

E-Z-PROFILE SHUNT PANEL

Variable resistors located in the enclosed shunt panel provide low-cost shortcuts to furnace profiling. E-Z-PROFILE is available for most models in the A100 and A200 Series. Refer to Furnace Model Tables.

RECRYSTALLIZED ALUMINA ELEMENT TUBES

If quartz is to be used at temperatures above 850° C in an A100, A200, or A400 Series furnace, it is recommended that a recrystallized 99.8% aluminum oxide element tube be substituted for the standard alumina tube to reduce devitrification of the quartz.

OTHER CUSTOM OPTIONS

Radial thermocouple ports, installed thermocouples, multi-zone elements, non-inductively wound heating elements, and radial viewing windows. Consult the factory.

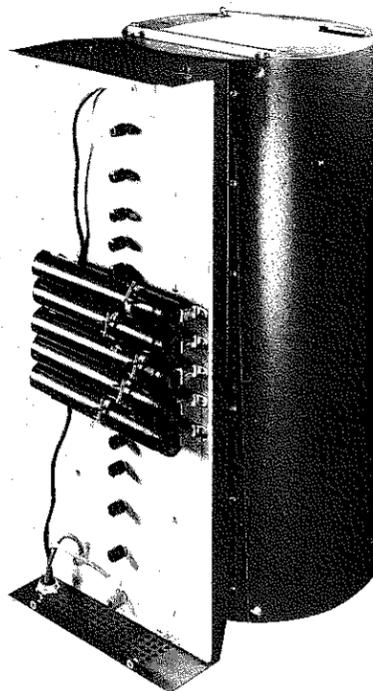

FURNACE SUPPORT STANDS

Model VS-1 universal furnace positioning mount and support stand permits positioning a furnace vertically or horizontally. A swivel mounting bracket on a vertical column attaches to the furnace mounting blocks.

For horizontal bench top operation, support pads attach to furnace mounting blocks. Specify HF-1.

TEMPERATURE CONTROLS

Astro temperature control systems feature a solid-state, 3-mode current proportioning, potentiometric control instrument and silicon controlled rectifier power regulator. Twelve single-zone models are available for use with the six Series of tubular furnaces.

The digital set point control instruments have millivolt scales and thumb-wheel setters. The combination provides superior setting accuracy since, with thumb-wheel switches and a matched resistor bank calibrated in millivolts, a thermocouple curve can be followed in a series of small steps, all within 1° C of the curve.

Three-mode control consists of adjustable proportional band and automatic reset and rate actions factory selected specifically for tubular furnace control requirements. Calibration and indicator accuracy are better than 0.5% of full scale. Control stability of furnace temperature is possible to within 1.0° C. All control instruments have a deviation meter, overshoot inhibition, voltage drop compensation, reference-junction compensation, upscale thermocouple break protection, and manual 0-100% power adjustment.

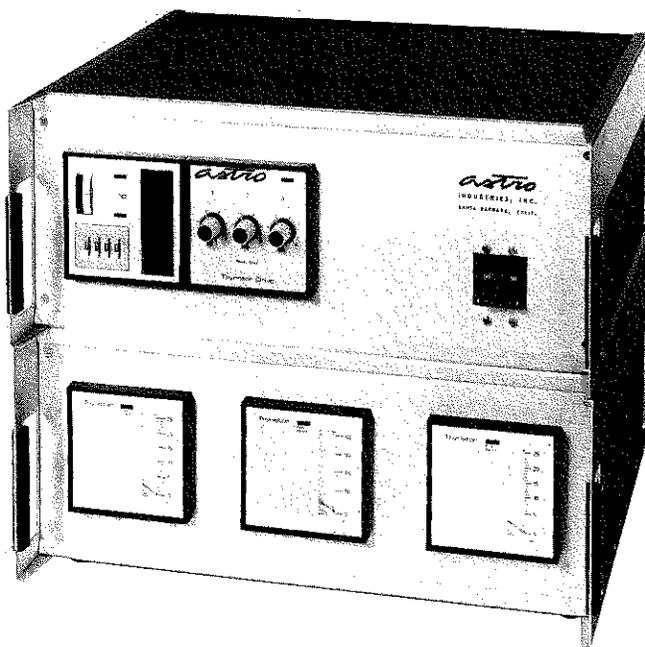

The silicon controlled rectifier, for resistive, inductive, or transformer-coupled loads, has an integral panel ammeter and fuse failure indicating lamp. Phase-angle firing is standard on all models and zero-firing can be optionally specified for straight resistive load applications. Current limit is included on the models recommended for platinum furnaces.

The models with 25 and 40-ampere SCR's have components installed in a compact cabinet 7" high x 15" deep x 17" wide with attractive anodized blue and clear aluminum panels. The 60-ampere models are in a 10" high cabinet. All systems are completely wired and ready for operation from specified 115/208/230 volt, 50/60 Hz, single-phase power service, and include a front panel main power circuit breaker, back panel thermocouple jack, power output connection, and power input cord. Lugs for 19" rack mounting are optionally available.

The Furnace Model Tables indicate the recommended temperature control models for each furnace.

Model 12K25 temperature control.

Typical three-zone temperature control.

TEMPERATURE CONTROLS

Model 12K25 temperature control.

Typical three-zone temperature control.

OPTIONS

Several control and power supply options are offered.

- SCALE RANGES**
 Additional digital scales include 0-19.99 mv for Type R thermocouples, and °C and °F scales for standard thermocouples.
- ALARMS**
 Integral high limit, low limit, or out of limit alarms are available for all control instruments.
- HIGH STABILITY CONTROL**
 High stability controllers can be substituted for standard instrumentation. The calibration and indicator accuracy of such controllers is better than $\pm 0.1^\circ\text{C}$. Such instrumentation can provide control stability of a few tenths of 1°C with careful design and normal laboratory conditions.
- POWER SUPPLIES**
 Zero-firing silicon controlled rectifiers can be specified for those designated models when the load is to be resistive only, and there are no current limit requirements.

ACCESSORIES AND SPECIAL SYSTEMS

- OVER TEMPERATURE PROTECTION**
 Over temperature instruments are available to monitor element or specimen temperatures. Relay outputs will activate audio and visual alarms and/or shut off furnace power.
- TEMPERATURE PROGRAMMERS**
 Linear ramp and curve following programmers are available for requirements ranging from the simple to the complex.
- TEMPERATURE RECORDERS**
 Recorders are available in single and multi-pen, single and multi-point models with several chart widths and speeds.
- MULTI-ZONE CONTROL**
 Various configurations of multi-zone temperature control are available.

Please consult the factory for complete information on all options, accessories, and special systems.

TRANSFORMERS

Most Astro A300, A400, A500, and A700 Series furnaces require step-down load transformers to match element and power supply voltages. Separately enclosed, Class H (150°C rise) transformers with capacities from .75 to 14.0 KVA are available. Furnace Model Tables indicate the transformer models required.

Also available for use with A300 Series furnaces are the Tri-One Series of transformers. The Tri-One transformers have multiple secondary taps permitting higher power input to the ends of the furnace than to the center, compen-

*A Zero-firing SCR can be specified for straight resistive loads.

sating for end losses. The heated length:bore diameter ratio required to achieve given uniformities in A300 Series furnaces can be reduced by using a Tri-One transformer. Specify Tri-One.

The recommended temperature controls shown on the Furnace Model Tables are the same with either type transformer.

THERMOCOUPLES

Standard Astro control systems are calibrated for Type K (chromel-alumel), Type S (platinum vs platinum 10% rhodium), or Type B (platinum 6% vs platinum 30% rhodium) thermocouples. Maximum recommended use temperatures are: Type K - 1250°C; Type S - 1550°C; Type B - 1750°C.

Bare-junction thermocouple assemblies are in double-bore, high purity aluminum oxide insulating tubes and include 10 feet of compensating lead wire. Thermocouples for use in the furnace bore or thermocouple well should be long enough to extend at least one-inch beyond the center of the furnace. Standard thermocouple lengths start at 12 inches, increasing in 6-inch increments.

Temperature control with linear ramp programmer.

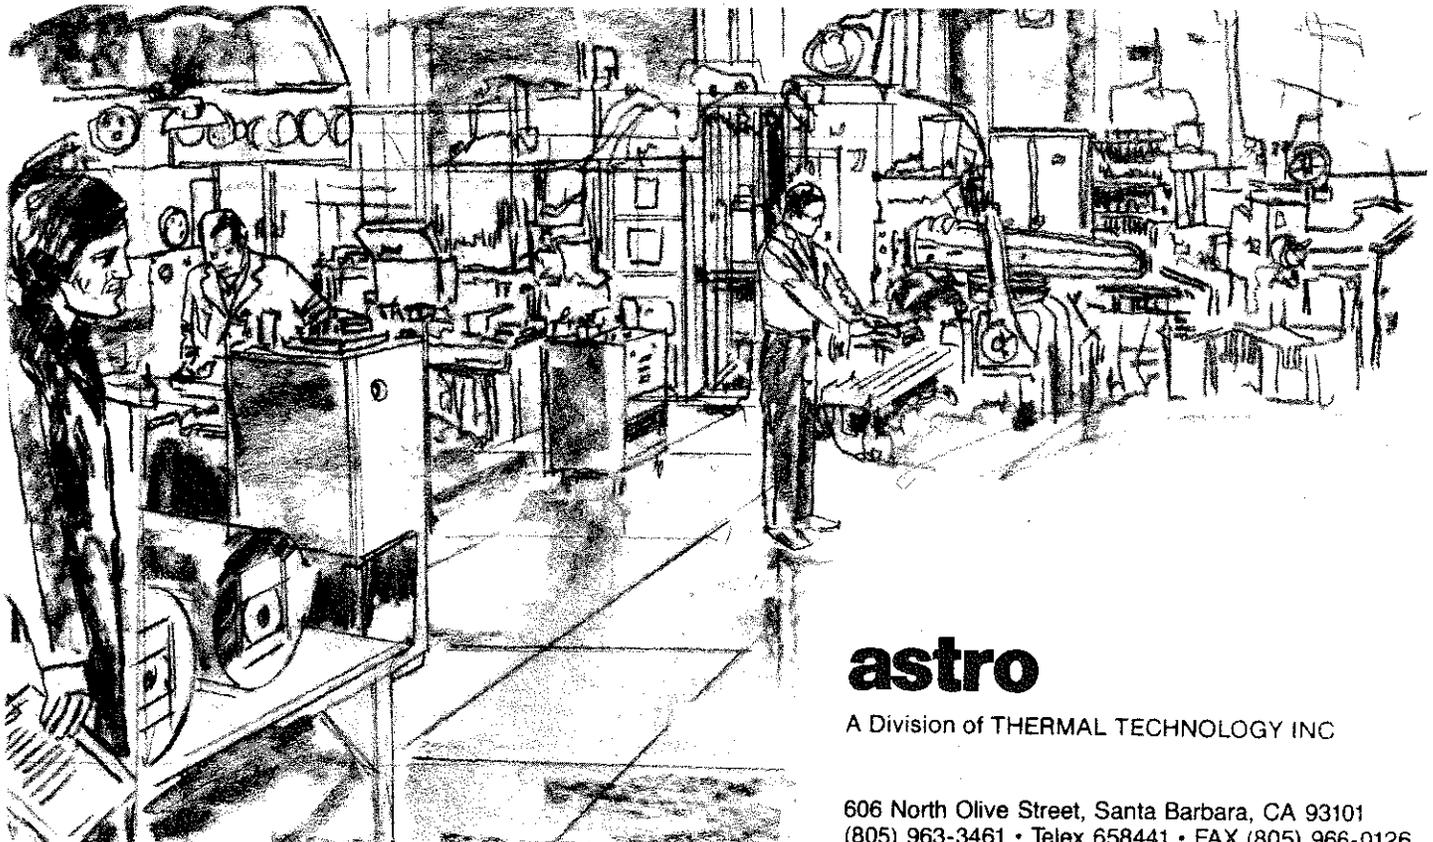

HOW TO SELECT AN ASTRO TUBULAR FURNACE SYSTEM

1. Determine the maximum and working temperatures required. (If uniformities of $\pm 1^{\circ}\text{C}$ or better are required, the maximum working temperature will be approximately 100°C below the maximum rated temperature of any furnace.) Select the furnace Series.
2. Determine furnace inside (hot zone) diameter.
3. Is furnace to be operated vertically or horizontally?
4. Determine uniformity requirements and calculate heated length necessary, using the guidelines given on page 3. Select a furnace model from one of the six tables.
5. The recommended temperature controller is shown on the Furnace Model Tables.
6. If required, the step-down load transformer model is shown on the Furnace Model Tables. On A300 Series furnaces a Tri-One Series transformer can be specified in lieu of the standard model transformer.
7. Specify line voltage available, checking compatibility with furnace voltage.
8. Determine thermocouple type and length.
9. Select a furnace support.

Please consult the factory if the operating requirements are not such that a furnace system can be selected as outlined above.

The factory can also offer assistance on custom systems and accessories for special applications. Astro tubular furnace systems can be designed for such applications as crystal growing, crystal pulling, tensile and creep testing, TGA, DTA, zone refining, and hot pressing.

Work tubes, vacuum/atmosphere retorts, motorized support systems for Bridgman and epitaxial crystal growing and zone refining, gas control and safety systems, and vacuum pumping systems are among the other accessories available.
